The Influence of Substrate Elasticity and Shear Rate on Human Blood Platelet Contraction Jana Hanke, 2018 Human blood platelets are small anucleate cell fragments that are important for the life saving mechanism of haemostasis i e the process to prevent a haemorrhage Upon injury blood platelets adhere to the exposed extra cellular matrix and spread clot and contract to close the wound This process has to work reliably in a multitude of different environments including surrounding tissues of various stiffnesses as well as the exposure of different shear flows due to blood circulation In the present work the reaction of human blood platelets to such environments is reported Specifically the spatial and temporal contraction behaviour of platelets and its variation is studied in response to elastic substrates within the stiffness range of 19 kPa to 83 kPa and shear rates between 14 s⁻¹ and 33 s⁻¹ corresponding to shear rates as found in larger veins To be able to visualise and analyse the contraction of the platelets time resolved traction force microscopy was employed together with a specifically tailored differential particle image velocimetry method and a microfluidic system It was found that platelets exhibit very dynamic contractile behaviour as well as comparatively high forces in the light of their small size The experimental results showed that platelets are not mechanosensitive within the studied stiffness or shear rate ranges This was observed both in the spatial and temporal force development as well as the final spread area reached by the platelets The force was instead depending on the spread area By modelling the cell as an elastic actively contracting disc and fitting this model to the dependency of the force on the area for data collected on various stiffnesses it was concluded that due to their small size platelets are only mechanosensitive to substrates of at least one order of magnitude softer than used here Under flow conditions it was shown that platelets do indeed adapt to the direction of the flow Here the preferred orientation of the contraction in comparison to the flow direction changed from 45° for the lower flow rates to roughly 90° for the highest shear rate To understand this result the stress distribution on the platelets surface under flow was simulated demonstrating the highest stress to be found roughly at 90° Hence the reported orientation of the

contraction is accounted for by the reduction of stress on the force transmitting network of the platelet connected to the underlying substrate In conclusion platelets are mechanoinensitive to a multitude of different environments indicating an all or nothing response to such cues

Photochemical Water Splitting Neelu Chouhan,Ru-Shi Liu,Jiujun Zhang,2017-01-27
Cleavage of water to its constituents i e hydrogen and oxygen for production of hydrogen energy at an industrial scale is one of the holy grails of materials science That can be done by utilizing the renewable energy resource i e sunlight and photocatalytic material The sunlight and water are abundant and free of cost available at this planet But the development of a stable efficient and cost effective photocatalytic material to split water is still a great challenge To develop the effective materials for photocatalytic water splitting various type of materials with different sizes and structures from nano to giant have been explored that includes metal oxides metal chalcogenides carbides nitrides phosphides and so on Fundamental concepts and state of art materials for the water splitting are also discussed to understand the phenomenon mechanism behind the photoelectrochemical water splitting This book gives a comprehensive overview and description of the manufacturing of photocatalytic materials and devices for water splitting by controlling the chemical composition particle size morphology orientation and aspect ratios of the materials The real technological breakthroughs in the development of the photoactive materials with considerable efficiency are well conversed to bring out the practical aspects of the technique and its commercialization

GIS Environmental Modelling and Engineering Allan Brimicombe,2003-08-29
Spatial dimensions need to be properly captured if modelling and engineering techniques are to be successfully applied in addressing environmental problems The links between the geographical information systems GIS that capture this data simulation modelling and engineering offer tremendous possibilities for building versatile support systems for managing the environment GIS Environmental Modelling and Engineering focuses on using GIS and external models to solve real environmental problems promoting the critical thinking needed for the effective applications of these systems and their analytical outputs Divided into three major sections this textbook first concentrates on defining GIS identifying how data is structured and explaining common functionality The text examines GIS from a technological perspective exploring the evolution of its scientific basis and its synergies with other technologies within a geocomputational paradigm The next section explores modelling from a neutral scientific perspective in its role of simulating phenomena as well as from a more specific perspective in its role within environmental science and engineering The third and largest section looks at how GIS and simulation modelling are joined It provides case studies and covers issues such as interoperability data quality model validity space time dynamics and decision support systems This volume provides seniors and postgraduate students with a structured coherent text that goes beyond introductory subject matter by enabling readers to think critically about the data acquisition process and the results they get from the technology
