W. Rohde,1982 **Mathematical Models in the Biosciences II** Michael Frame,2021-01-01 Volume Two of an award winning professor s introduction to essential concepts of calculus and mathematical modeling for students in the biosciences This is the second of a two part series exploring essential concepts of calculus in the context of biological systems Building on the essential ideas and theories of basic calculus taught in Mathematical Models in the Biosciences I this book focuses on epidemiological models mathematical foundations of virus and antiviral dynamics ion channel models and cardiac arrhythmias vector calculus and applications and evolutionary models of disease It also develops differential equations and stochastic models of many biomedical processes as well as virus dynamics the Clancy Rudy model to determine the genetic basis of cardiac arrhythmias and a sketch of some systems biology Based on the author s calculus class at Yale the book makes concepts of calculus less abstract and more relatable for science majors and premedical students *The Shock and Vibration Digest* ,1990 **Routledge Revivals: Behavioral Problems in Geography (1969)** Kevin Cox,Reginald Golledge,2017-11-22 Originally published in 1969 Behavioral Problems in Geography unpacks and identifies elements of behavioral models and theories The book seeks to examine their specific effects on spatial activity and to operationalize some of the concepts previously used in a subjective and descriptive manner All papers are united by a common concern for the building of geographic theory regarding human behavior Contributions in the volume vary a great deal in their emphasis ranging from philosophy and review to theorizing

and operationalization Each paper recognizes the importance of examining the behavioural basis of spatial activity This book will appeal to scholars of geography and psychology alike *Dynamic Systems* Craig A. Kluever, 2015-04-06 Craig Kluever's *Dynamic Systems Modeling Simulation and Control* highlights essential topics such as analysis design and control of physical engineering systems often composed of interacting mechanical electrical and fluid subsystem components The major topics covered in this text include mathematical modeling system response analysis and an introduction to feedback control systems *Dynamic Systems* integrates an early introduction to numerical simulation using MATLAB's Simulink for integrated systems Simulink and MATLAB tutorials for both software programs will also be provided The author's text also has a strong emphasis on real world case studies
