Mathematics for the Life Sciences Erin N. Bodine,Suzanne Lenhart,Louis J. Gross,2014-08-17 An accessible undergraduate textbook on the essential math concepts used in the life sciences The life sciences deal with a vast array of problems at different spatial temporal and organizational scales The mathematics necessary to describe model and analyze these problems is similarly diverse incorporating quantitative techniques that are rarely taught in standard undergraduate courses This textbook provides an accessible introduction to these critical mathematical concepts linking them to biological observation and theory while also presenting the computational tools needed to address problems not readily investigated using mathematics alone Proven in the classroom and requiring only a background in high school math Mathematics for the Life Sciences doesn't just focus on calculus as do most other textbooks on the subject It covers deterministic methods and those that incorporate uncertainty problems in discrete and continuous time probability graphing and data analysis matrix modeling difference equations differential equations and much more The book uses MATLAB throughout explaining how to use it write code and connect models to data in examples chosen from across the life sciences Provides undergraduate life science students with a succinct overview of major mathematical concepts that are essential for modern biology Covers all the major quantitative concepts that national reports have identified as the ideal components of an entry level course for life science students Provides good background for the MCAT which now includes data based and statistical reasoning Explicitly links data and math modeling Includes end of chapter homework problems end of unit student projects and select answers to homework problems Uses MATLAB throughout and MATLAB m files with an R supplement are available online Prepares students to read with comprehension the growing quantitative literature across the life sciences A solutions manual for professors and an illustration package is available

Luo,Benjamin Smith,2022-08-18 Carbon moves through the atmosphere through the oceans onto land and into ecosystems This cycling has a large effect on climate changing geographic patterns of rainfall and the frequency of extreme weather and is altered as the use of fossil fuels adds carbon to the cycle The dynamics of this global carbon cycling are largely predicted over broad spatial scales and long periods of time by Earth system models This book addresses the crucial question of how to

assess evaluate and estimate the potential impact of the additional carbon to the land carbon cycle The contributors describe a set of new approaches to land carbon cycle modeling for better exploring ecological questions regarding changes in carbon cycling employing data assimilation techniques for model improvement and doing real or near time ecological forecasting for decision support This book strives to balance theoretical considerations technical details and applications of ecosystem modeling for research assessment and crucial decision making Key Features Helps readers understand implement and criticize land carbon cycle models Offers a new theoretical framework to understand transient dynamics of land carbon cycle Describes a suite of modeling skills matrix approach to represent land carbon nitrogen and phosphorus cycles data assimilation and machine learning to improve parameterization and workflow systems to facilitate ecological forecasting Introduces a new set of techniques such as semi analytic spin up SASU unified diagnostic system with a 1 3 5 scheme traceability analysis and benchmark analysis for model evaluation and improvement Related Titles Isabel Ferrera ed Climate Change and the Oceanic Carbon Cycle Variables and Consequences ISBN 978 1 774 63669 5 Lal R et al eds Soil Processes and the Carbon Cycle ISBN 978 0 8493 7441 8 Windham Myers L et al eds A Blue Carbon Primer The State of Coastal Wetland Carbon Science Practice and Policy ISBN 978 0 367 89352 1
