of this book contains three chapters describing and witnessing some of Vladimir Vapnik's contributions to science. In the first chapter, L. Bottou discusses the seminal paper published in 1968 by Vapnik and Chervonenkis that lay the foundations of statistical learning theory and the second chapter is an English language translation of that original paper. In the third chapter, Alexey Chervonenkis presents a first hand account of the early history of SVMs and valuable insights into the first steps in the development of the SVM in the framework of the generalised portrait method. The remaining chapters by leading scientists in domains such as statistics, theoretical computer science and mathematics address substantial topics in the theory and practice of statistical learning theory including SVMs and other kernel based methods, boosting, PAC Bayesian theory, online and transductive learning, loss functions, learnable function classes, notions of complexity for function classes, multitask learning and hypothesis selection. These contributions include historical and context notes, short surveys and comments on future research directions. This book will be of interest to researchers, engineers and graduate students engaged with all aspects of statistical learning.
