Energy Losses in Big Woodworking Machines Boycho Marinov, 2023-07-26 This monograph presents research related to big woodworking machines and in particular research related to big circular and big band saw machines These machines are characterized by their size which creates problems both in their design and during their normal operation Big static and dynamic loads occur during the technological process of sawing These loads give rise to deformations of the main links of the machines The final result is increased electricity consumption The monograph includes four chapters In the first chapter the

influence of static and dynamic loads on the main links of machines is investigated In the second chapter transverse vibrations and spatial deformations of machine shafts are investigated In the third chapter deformation checks are made which can prevent damages in machines In the fourth chapter the kinetic energy losses of the two classes of machines are investigated The main purpose of these studies is to propose optimization solutions that lead to the minimization of energy losses

Elements of Strength of Materials Dr. I.S.N.V.R. Prasanth, Er. Ramineni Surendra Babu, Dr. G.Vani,Er. R.Saleema Begum, The study of the response of solid objects when they are subjected to stresses and strains is known as the strength of materials which is sometimes referred to as the mechanics of materials Material strength is defined as the point on the engineering stress strain curve known as the yield stress which is the point beyond which the material undergoes deformations that will not be entirely reversed upon removal of the loading As a consequence the member will have a deflection that is permanent The point on the engineering stress strain curve that corresponds to the stress that causes a material to fracture is known as the ultimate strength of the material Strength of materials often known as the mechanics of materials is a discipline that primarily relates to the many techniques of estimating the stresses and strains in structural components like beams columns and shafts The techniques that are used to anticipate the reaction of a structure under loading and its susceptibility to different failure modes take into consideration the characteristics of the materials such as the yield strength ultimate strength Young modulus and Poisson ratio of the material This ensures that an accurate prediction can be made In addition one must take into account the macroscopic qualities geometric properties of the mechanical element These include the element length breadth thickness boundary limitations and sudden changes in geometry such as holes
