Fault Mechanics And Transport Properties Of Rocks:

Fault Mechanics and Transport Properties of Rocks Brian Evans, Teng-fong Wong, 1992-08-04 This festschrift compiled from the symposium held in honor of W F Brace is a timely overview of fault mechanics and transport properties of rock State of the art research is presented by internationally recognized experts who highlight developments in this contemporary area of study subsequent to Bill Brace s pioneering work Key Features The strength of brittle rocks The effects of stress and stress induced damage on physical properties of rock Permeability and fluid flow in rocks The strength of rocks and tectonic processes Fault Mechanics and Transport Properties of Rocks Brian Evans, Teng-fong Wong, 1992 **Fault Mechanics and Transport Properties of Rocks** Brian Evans, 2000 **Fault Mechanics and Transport Properties of Rocks** Teng-Fong Wong, Brian Evans, 1992 Rock Damage and Fluid Transport, Part II Arno Zang, Ove Stephansson, G. Dresen, 2007-11-05 Mechanical properties and fluid transport in rocks are intimately linked as deformation of a solid rock matrix immediately affects the pore space and permeability The coupling of fluid circulation and deformation processes in crustal rocks results in significant complexity of the mechanical and fluid transport behavior This often poses severe technical and economic problems for reservoir and geotechnical engineering projects involved in oil and gas production CO2 sequestration mining and underground waste disposal The volume results from the 5th Euroconference on Rock Physics and Geomechanics which was held in Potsdam Germany in September 2004 Part I of the topical volume mainly contains contributions investigating the nucleation and evolution of crack damage in rocks new or modified techniques to measure rock fracture toughness and a discussion of upscaling techniques relating mechanical and fluid transport behavior in rocks at different spatial scales Part II contains contributions discussing fluid flow and transport in rocks as observed on the laboratory scale and in boreholes The evolution of rock damage pertinent to the stability of underground excavations is studied and scaling relations of elastic properties and seismic events are discussed The Relationship Between Damage and Localization Helen Lewis, G. D. Couples, 2007 The many kinds of porous geomaterials rocks soils concrete etc exhibit a range of responses when undergoing inelastic deformation In doing so they commonly develop well ordered fabric elements forming fractures shear bands and compaction bands so creating the planar fabrics that are regarded as localization Because these induced localization fabrics alter the bulk material properties such as permeability acoustic characteristics and strength it is important to understand how and why localization occurs and how it relates to its setting The concept of damage in several uses describes both the precursor to localization and the context within which it occurs A key theme is that geomaterials display a strong material evolution during deformation revealing a close linkage between the damage and localization processes This volume assembles perspectives from a number of disciplines including soil mechanics rock mechanics structural geology seismic anisotropy and reservoir engineering The papers range from theoretical to observational and include contributions showing how the deformed geomaterial s emergent bulk characteristics like

permeability and seismic anisotropy can be predicted Rock Deformation from Field, Experiments and Theory D.R. Faulkner, E. Mariani, J. Mecklenburgh, 2015-10-26 Ernie Rutter has made and continues to make a significant impact in the field of rock deformation. He has studied brittle and plastic deformation processes that occur within both the oceanic and continental crust as well as other key properties such as the permeability and seismic velocities of these rocks. His approach has been one that integrates field observations, laboratory experiments and theoretical analyses. This volume celebrates Ernie's key contribution to rock deformation and structural geology by bringing together a collection of papers that represent this broad approach. The papers within the volume address key issues that remain within these fields. These range from fundamental studies of brittle and plastic behaviour along with the resultant structures and microstructures from both the field and laboratory to applied problems where a better understanding of the deformation and properties of the crust is still needed.

Emerging Technologies and Techniques in Porous Media Derek B. Ingham, Adrian Bejan, Eden Mamut, Ian Pop, 2012-12-06 Heat and fluid flow in fluid saturated porous media has become increasingly more attractive to researchers and thus it has become a very productive field for many researchers and practical engineers in a very diverse range of fields. The great interest in the topic stems from its widespread number of different practical applications in modern industries and in many environmental issues such as nuclear waste management, building thermal insulators, geothermal power plants, grain storage etc. In building sciences and thermal insulation engineering an appreciable insulating effect has been derived by placing porous material in the gap between the cavity walls and multishield structures of nuclear reactors between the pressure vessel and the reactor. Geophysical applications include modeling of the spread of pollutants e.g. radioactive material, water movements in geothermal reservoirs, enhanced recovery of petroleum reservoirs etc. These and many other important practical applications have resulted in a rapid expansion of research in the general area of porous media and thus generated a vast amount of both theoretical and experimental research work. It has attracted the attention of industrialists, engineers and scientists from many varying disciplines such as applied mathematics, chemical, civil, environmental, mechanical and nuclear engineering, geothermal physics, food science, medicine etc. This book contains some of the contributions to the NATO Advanced Study Institute on Emerging Technologies and Techniques in Porous Media that was held in Neptun Olimp Constanta, Black Sea, Romania on 9-20 June 2003.
