## Lesson Summary

### Describing Populations

**Ecological Systems** Most ecologists study populations. Ecologists study a particular community of living organisms, which usually are sharing a particular habitat (or habitats).

**Change after Change** They give us a population's life history by graphing its age- or stage-specific mortality rates. They calculate the population's resistance to its environment, a positive value indicating that it is resistant, and a negative value indicating that it is not. They also give a population's life span, the age at which it dies. They give the population's growth rate, the rate at which it is growing.

**Growth Rate** The number of organisms in a population can change over time, as it grows or declines. Population numbers can grow rapidly under conditions of high birth, death rate, and low death rate, or slowly under conditions of low birth, death rate, and high death rate.

**Life History** The life history of a population is the history of its growth, decline, and extinction. It is the history of the population's life.

Poetics of Liveliness Ada Smailbegović,2021-10-29 Can poetry act as an aesthetic amplification device akin to a microscope through which we can sense minute or nearly imperceptible phenomena such as the folding of molecules into their three dimensional shapes the transformations that make up the life cycle of a silkworm or the vaporous movements that constitute the ever shifting edges of clouds We tend to think of these subjects as reserved for science but as Ada Smailbegović argues twentieth and twenty first century writers have intermingled scientific methodologies with poetic form to reveal unfolding processes of change Their works can be envisioned as laboratories within which the methodologies of experimentation natural historical description and taxonomic classification allow poetic language to register the rhythms and durations of material transformation Poetics of Liveliness moves across scales to explore the realms of molecules fibers

tissues and clouds It investigates works such as Christian B k s insertion of a poetic text into the DNA code of living bacteria in order to generate a new poem in the shape of a protein molecule Jen Bervin s considerations of silk fibers and their use in biomedicine Gertrude Stein s examination of brain tissues in medical school and its subsequent influence on her literary taxonomies of character and Lisa Robertson s studies of nineteenth century meteorology and the soft architecture of clouds In their attempt to understand physical processes unfolding within lively material worlds Smailbegovi contends these poets have developed a distinctive materialist poetics Structured as a poetic cosmology akin to Lucretius s On the Nature of Things which begins at the atomic level and expands out to the vastness of the universe Poetics of Liveliness provides an innovative and surprising vision of the relationship between science and poetry [The Illustrated London News](#) ,1887
