**Guided Notes**  
**Section 1: Freshwater Ecosystems**

**Freshwater Ecosystems**

- The types of organisms in an aquatic ecosystem are mainly determined by the water's salinity. As a result, aquatic ecosystems are divided into freshwater and marine ecosystems.
- Freshwater ecosystems include ponds lakes streams rivers and wetlands.
- Wetlands are areas of land that are periodically underwater or whose soil contains a great deal of moisture.

**Characteristics of Aquatic Ecosystems**

- Factors such as temperature, sunlight, oxygen, and nutrients determine which organisms live in which area of the water.
- Aquatic ecosystems contain several types of organisms that are grouped by their location and by their adaptation.
- Three groups of aquatic organisms include plankton, nekton, and benthos.
- Plankton are the mass of mostly microscopic organisms that float or drift freely in the water, and can be microscopic animals called zooplankton or microscopic plants called phytoplankton.
- Nekton, are all organisms that swim actively in open water, independent of currents.
- Benthos are bottom-dwelling organisms of the sea or ocean and are often attached to hard surfaces.
- Decomposers are also aquatic organisms.

**Lakes and Ponds**

- Lakes, ponds, and wetlands can form naturally where groundwater reaches the Earth's surface.
- Humans intentionally create artificial lakes by damming flowing rivers and streams to use them for power, irrigation, water storage, and recreation.
- Lakes and ponds can be structured into horizontal and vertical zones. The types of organisms present depend on the amount of sunlight available.

**Life in a Lake**

- The littoral zone reaches the bottom and nurtures plants and aquatic life is diverse and abundant.
- Some plants are rooted in the mud underwater with their upper leaves and stems above water. Other plants have floating leaves.
- In open water, plants, algae, and some bacteria capture solar energy to make their own food during photosynthesis.
- Some bodies of fresh water have areas so deep that there is too little light for photosynthesis.
- Bacteria live in the deep areas of freshwater. Fish adapted to cooler, darker water also live there.
- Eventually, dead and decaying organisms reach the benthic zone.
- The benthic zone is the region near the bottom of a pond, lake or ocean which is inhabited by decomposers, insect larvae, and clams.
- Animals that live in lakes and ponds have adaptations that help them obtain what they need to survive. For example, water beetles use the hairs under their bodies to trap surface air so that they can breathe during their dives for food.

[Environmental Systems Analysis with MATLAB®](#) Stefano Marsili-Libelli, 2018-09-03 Explore the inner workings of environmental processes using a mathematical approach Environmental Systems Analysis with MATLAB combines

environmental science concepts and system theory with numerical techniques to provide a better understanding of how our environment works. The book focuses on building mathematical models of environmental systems and using these models to analyze their behaviors. Designed with the environmental professional in mind, it offers a practical introduction to developing the skills required for managing environmental modeling and data handling. The book follows a logical sequence from the basic steps of model building and data analysis to implementing these concepts into working computer codes and then on to assessing their results. It describes data processing rarely considered in environmental analysis, outlines the tools needed to successfully analyze data and develop models, and moves on to real world problems. The author illustrates in the first four chapters the methodological aspects of environmental systems analysis and in subsequent chapters applies them to specific environmental concerns. The accompanying software bundle is freely downloadable from the book web site. It follows the chapters sequence and provides a hands on experience allowing the reader to reproduce the figures in the text and experiment by varying the problem setting. A basic MATLAB literacy is required to get the most out of the software. Ideal for coursework and self study, this offering Deals with the basic concepts of environmental modeling and identification both from the mechanistic and the data driven viewpoint. Provides a unifying methodological approach to deal with specific aspects of environmental modeling population dynamics flow systems and environmental microbiology. Assesses the similarities and the differences of microbial processes in natural and man made environments. Analyzes several aquatic ecosystems case studies. Presents an application of an extended Streeter Phelps S P model. Describes an ecological method to estimate the bioavailable nutrients in natural waters. Considers a lagoon ecosystem from several viewpoints including modeling and management and more.
