

Why?

From fireworks to stars, the color of light is useful in finding out what's in matter. The emission of light by hydrogen and other atoms has played a key role in understanding the electronic structure of atoms. Trace materials, such as evidence from a crime scene, lead in paint or mercury in drinking water, can be identified by heating or burning the materials and examining the color(s) of light given off in the form of bright-line spectra.

Model 1 – White Light

- Trace the arrows in Model 1 and shade in the table with colored pencils where appropriate.
- What happens to white light when it passes through a prism?
it emits red, orange, yellow, green, blue & violet colors
- Why are the color labels in the table in Model 1 plural (i.e., "Reds" rather than "Red")?
b/c there are various wavelengths of the red color
- Do all colors of light travel at the same speed?
yes
- Do all colors of light have the same energy? If no, which colors have the highest energy and the least energy, respectively?
no. violet is highest E and red is the lowest.
- Consider the light illustrated in Model 1.
 - Which color corresponds to the longest wavelengths?
red
 - Which color corresponds to the shortest wavelengths?
violet
 - Write a sentence that describes the relationship between wavelength and energy of light.
when the wavelengths are shorter, the energy of light is higher

Electron Energy in Solids Joseph Callaway, 1958 *Theoretical Treatment of Electron Emission and Related Phenomena* Benjamin Seznek, Tiberiu Minea, Philippe Dessante, Philippe Teste, Gilles

Maynard, 2022-06-14 This book introduces readers to the physics governing electron emission under high voltages and temperatures and highlights recent modeling and numerical developments for describing these phenomena It begins with a brief introduction presenting several applications that have driven electron emission research in the last few decades The authors summarize the most relevant theories including the physics of thermo field electron emission and the main characteristic parameters Based on these theories they subsequently describe numerical multi physics models and discuss the main findings on the effect of space charges emitter geometry pulse duration etc Beyond the well known photoelectric effect the book reviews recent advanced theories on photon metal interaction Distinct phenomena occur when picosecond and femtosecond lasers are used to irradiate a surface Their consequences on metal electron dynamics and heating are presented and discussed leading to various emission regimes in and out of equilibrium In closing the book reviews the effects of electron emission on high voltage operation in vacuum especially breakdown and conditioning as the most common examples The book offers a uniquely valuable resource for graduate and PhD students whose work involves electron emission high voltage holding laser irradiation of surfaces vacuum or discharge breakdown but also for academic researchers and professionals in the field of accelerators and solid state physics with an interest in this highly topical area

Ingólfsson, 2019-04-23 Low energy electrons are ubiquitous in nature and play an important role in natural phenomena as well as many potential and current industrial processes Authored by 16 active researchers this book describes the fundamental characteristics of low energy electron molecule interactions and their role in different fields of science and technology including plasma processing nanotechnology and health care as well as astro and atmospheric physics and chemistry The book is packed with illustrative examples from both fundamental and application sides features about 130 figures and lists over 800 references It may serve as an advanced graduate level study course material where selected chapters can be used either individually or in combination as a basis to highlight and study specific aspects of low energy electron molecule interactions It is also directed at researchers in the fields of plasma physics nanotechnology and radiation

 famous series of lectures at Columbia University Gathered in one volume and published as The Theory of Electrons in 1909
 these talks are still widely read and admired today more than 100 years later This collection includes lectures on the theory
 of free electrons the emission and absorption of heat the theory of the Zeeman effect the propagation of light in a body
 composed of molecules the theory of the inverse Zeeman effect the optical phenomena in moving bodies Extensive notes
 complete with mathematical equations complement the text and an extensive index will aid the reader Dutch physicist

 Modern Physics 1927 The Enigmatic Electron Ann Jones,2021-07-30 The electron discovered in 1897 was found to be a
 constituent of all atoms While the nucleus of the atom remains fixed the electrons are free to move with different amounts of
 energy When supplied with more energy by physical or mechanical means light is produced when the original energy state is
 reached Electrons can easily be removed altogether from the atom as in the case of electric current This has given rise to our
 electrical and electronic industries The associated magnetic field allowed motors and dynamos to be developed Rapid

movement of electrons results in the production of electromagnetic waves from the longest wavelengths radio waves to the shortest wavelengths gamma rays This has had a huge impact on our lives in the fields of medicine and telecommunications A beam of electrons can be directed in the same way as a beam of light As light can show wave particle duality so can an electron beam Its measured wavelength is about the same as X rays This means electrons can be diffracted The famous double slit experiment where a single electron appears to interfere with itself cannot be explained by classical physics and so we enter the strange world of quantum mechanics The birth of the quantum computer is not far away and will be much faster than existing computers Finally all chemical reactions are the result of electron movement between reactants

Electron energy loss spectroscopy ELS is a vast subject with a long and honorable history The problem of stopping power for high energy particles interested the earliest pioneers of quantum mechanics such as Bohr and Bethe who laid the theoretical foundations of the subject The experimental origins might perhaps be traced to the original Franck Hertz experiment The modern field includes topics as diverse as low energy reflection electron energy loss studies of surface vibrational modes the spectroscopy of gases and the modern theory of plasmon excitation in crystals For the study of ELS in electron microscopy several historically distinct areas of physics are relevant including the theory of the Debye Waller factor for virtual inelastic scattering the use of complex optical potentials lattice dynamics for crystalline specimens and the theory of atomic ionisation for isolated atoms However the field of electron energy loss spectroscopy contains few useful texts which can be recommended for students With the recent appearance of Raether's and Egerton's books see text for references we have for the first time both a comprehensive review text due to Raether and a lucid introductory text which emphasizes experimental aspects due to Egerton Raether's text tends to emphasize the recent work on surface plasmons while the strength of Egerton's book is its treatment of inner shell excitations for microanalysis based on the use of atomic wavefunctions for crystal electrons
