Background: The pitch of a sound, or how shrill or deep it is, is related to the frequency of the sound waves. The greater the frequency of sound waves reaching your ears, the more shrill the pitch and frequency and the greater pitch. The rate of frequency is the faster (fast).

Question: What causes the Doppler shift?

- Scenario:** A siren on a truck is moving to the right and past you, a first flag. Notice the sound waves moving away from the source as it travels.

 - As the sound waves move to the right, the sound waves are compressed together. How does this affect the frequency of the sound? They are closer together.
 - When the wavelength of the sound is short, the sound pitch is high.
 - Now, decrease the frequency by moving the siren to the left. How does this affect the spacing of the sound waves? Sound waves that are compressed together.
- Scenario:** A siren on a truck is moving to the right and past you, a first flag. Notice the sound waves moving away from the source as it travels. A second flag is also observing a siren. How does the observed frequency of the sound waves change? It changes.

Imagine a siren on a truck is moving to the right and past you, a first flag. Notice the sound waves moving away from the source as it travels.

 - What is the frequency of sound waves as they move past you?
 - What flag, and then the second flag, is observing the sound waves? The frequency of sound waves is the same as the frequency of the sound waves.
