

Student Exploration: Photosynthesis Lab

Background: Photosynthesis converts inorganic carbon dioxide (CO_2) and water into organic carbohydrates (sugars).

Prior Knowledge: How does chlorophyll absorb light energy? (See Lab 1.)

- a. To measure, what gas does photosynthesis produce?

Oxygen

- b. Where is this gas produced?

From aquatic producers (green plants) during photosynthesis.

Green plants are

photoautotrophic, meaning they use the energy of light to produce **sugars** ($\text{C}_6\text{H}_{12}\text{O}_6$) from **carbon dioxide** (CO_2) and water (H_2O). Chlorophyll is a green pigment that plants use for absorption of light energy and for trapping electrons for energy metabolism.

a. Experimental photosynthesis technology: Plants use water as the electron source, and release O_2 as a byproduct of this photosynthesis. A red dye, phenolphthalein, turns red if photosynthesis is producing oxygen production.

- b. Chlorophyll will give a color effect to the green that the indicator does?

Using evidence, the indicator will change color that green (chlorophyll).

- c. When chlorophyll is added to the green, under the light, photosynthesis will occur. Light intensity will have a direct effect on oxygen production?

Yes, because the more light there is, the more photosynthesis will occur. The more photosynthesis, the more oxygen will be produced.

- d. Experiment with the control temperature using water to find the O_2 level change.

- a. How does temperature affect oxygen production?

Temperature affects the rate of photosynthesis. As temperature increases, the rate of photosynthesis increases up to a point, after which it decreases.
