

Extended Response Question- Intelligence

Intelligence has been defined in many different ways including, abstract thoughts, understanding, self-awareness, communication, learning new knowledge, having emotional knowledge and problem solving. There are different kinds of theories of intelligence including Charles Spearman's factor g, Howard Gardner's multiple intelligence and few others.

The theory of multiple intelligence was proposed by Howard Gardner in 1983 that describes intelligence into various specific stages, rather than saying that intelligence is a single ability. In Gardner's theory he argues that there is a wide range of cognitive abilities. The theory predicts that a child who learns to multiply easily is not necessarily more intelligent than a child who has more difficulty on this task. His theory explains that humans have eight abilities of intelligences such as spatial, linguistic, logical-mathematical, bodily-kinaesthetic, musical, intrapersonal, interpersonal and naturalistic. He considers that moral intelligence may also be worthy of inclusion.

Charles Spearman developed his theory through a statistical method called factor analysis. He gave different tests to many children, measuring their ability on various tasks which he assumed were associated intelligence for example general knowledge and reasoning. Spearman found that individuals who scored high on one kind of test who tended to score high on others. Spearman concluded that this relationship was due to general underlying factor which we all possess in varying amounts. He called this factor "g" and described g as a kind of well or stream of mental energy that flows into everything an individual does. Charles Spearman's model of intelligence is based on his observation that all tests of mental abilities are positively correlated. Spearman also believed that two other factors affect performance on mental abilities tests. One was the general factor or general intelligence; this is focused on the mental relation of all mental tests.

The major difference between their two intelligence theories is that Spearman believed that intelligence could measure by IQ tests or mental abilities tests. Gardner however believed that intelligence could not be tied down to just one definition because there is more one type of human intelligence. Another difference between the two psychologist's theories are basically the same, but explained differently. Spearman's theories are narrow focusing on one general type of intelligence, G and reaction time. Gardner's theories are essentially the same but broader focusing on multiple intelligences. Point here is that Gardner doesn't believe that one intelligence can be sufficient to determine intelligence. As for overall use of these theories, Spearman's theory has more evidence that it works compared to Gardner's theory. The proof conquers that there is a connection between someone's IQ and simple everyday tasks. The only place where Spearman's theory is suspect is that it doesn't account for all people. Example; if you gave a poor child an intelligence test, they would probably score poorly thus be deemed to have a below average intelligence. However, the child probably knows how to do basic math to survive and get by, consequently, it can't take into account different talents that certain individuals have.

Now the major way that both of these great psychologist theories are similar is that during their development they were criticized for not having enough empirical evidence. Many other psychologists believed they were basing these theories on pure intuition and guessing rather than on real physical evidence. Both men when developing their theories sought to reshape and broaden their era's general definition of intelligence. They both succeed in this task in that as of today many
