The objective of this research was to enable the automatic generation of verified maintenance instructions The approach to  
the problem was to divide the overall program into three main research areas The first area was to develop state of%the art  
Computer Aided Design CAD analysis algorithms to generate valid assembly and disassembly sequences from the 3D CAD  
geometry The second area targeted natural language techniques to generate understandable maintenance instructions and  
the third area focused on algorithms that could support verifying the instructions in an immersive environment with force  
feedback The program began with the development of a high level concept of the solution to each research area and a  
defined set of tasks for each research area that coincided with the high level concepts As the research progressed and more  
was leaned about the problems and the true business needs the concepts and subtask efforts were refined This report  
documents for each research area 1 the solution approach 2 the subtasks associated with each area and 3 a discussion of  
how these subtasks add up to a solution to the original problem For each subtask a description of the results achieved  
including algorithmic descriptions etc and how lessons learned during the program affected each subtask Following the  
research area descriptions is documentation for wrapping the three technology results into one comprehensive  
demonstration platform The report then describes how this platform was used to demonstrate the technology capabilities to  
the user and the results of these demonstrations The final phase of the report discusses the strengths%weaknesses of the  
technology where it appears to be going and growth areas for the research **General Service Manual for Stinson**
