Memory, Amnesia, and the Hippocampal System Neal J. Cohen, Howard Eichenbaum, 1993 In this sweeping synthesis Neal J Cohen and Howard Eichenbaum bring together converging findings from neuropsychology neuroscience and cognitive science that provide the critical clues and constraints for developing a more comprehensive understanding of memory Specifically they offer a cognitive neuroscience theory of memory that accounts for the nature of memory impairment exhibited in human amnesia and animal models of amnesia that specifies the functional role played by the hippocampal system in memory and that provides further understanding of the componential structure of memory The authors central thesis is that the hippocampal system mediates a capacity for declarative memory the kind of memory that in humans supports conscious recollection and the explicit and flexible expression of memories They argue that this capacity emerges from a representation of critical relations among items in memory and that such a relational representation supports the ability to make inferences and generalizations from memory and to manipulate and flexibly express memory in countless ways In articulating such a description of the fundamental nature of declarative representation and of the mnemonic capabilities to which it gives rise

the authors theory constitutes a major extension and elaboration of the earlier procedural declarative account of memory
Support for this view is taken from a variety of experimental studies of amnesia in humans nonhuman primates and rodents
Additional support is drawn from observations concerning the neuroanatomy and neurophysiology of the hippocampal system
The data taken from divergent literatures are shown to converge on the central theme of hippocampal involvement in
declarative memory across species and across behavioral paradigms *Study Guide to Accompany Seasons of Life 4e*
