

Implicit and Explicit Attitudes Toward Mainstream and BDSM Sexual Practices and Their Relation to Interviewer Behavior: an Analogue Study

Abstract The present study examined participants' implicit and explicit attitudes toward mainstream and BDSM (bondage and discipline/dominance and submission/sadism and masochism) sexual terms using the Implicit Relational Assessment Procedure (IRAP) and several questionnaires and investigated the relationship between scores on these measures and participant behavior toward a BDSM-labeled and a non-BDSM-labeled confederate during an interviewing task. Twenty-one participants, who were either graduate psychology students or practicing clinicians, completed the study. Results were consistent with previous research (Stockwell, Walker, & Eshleman, *The Psychological Record*, 60(2), 307–324, 2010) in that responses on both the IRAP and Visual Analogue Scales showed an acceptance of mainstream sexual terms and unfavorable responding to BDSM terms; in contrast, Likert-scale questionnaire responses generally reflected favorable attitudes toward people who practice BDSM. IRAP scores were positively correlated with differences in smiling across the two interview conditions; that is, participants with anti-BDSM responding on the IRAP smiled significantly less while interviewing the BDSM-labeled

confederate than when they interviewed the non-BDSM confederate. No other differences in interviewing behavior were observed or correlated with IRAP responding, suggesting that implicit attitudes may not be a reliable predictor of participant behavior during interviews of individuals labeled as practicing BDSM.

Keywords Implicit Relational Assessment Procedure · BDSM · Implicit attitudes · Sexual behavior · Relational frame theory · Clinical interview

Although there has been substantial research conducted to assess the relationship between implicit attitudes and behavior (e.g., Latu, Mast, & Stewart, 2015; Nicholson & Barnes-Holmes, 2012; Pavlović, Žebelj, Marinković, & Sučević, 2016; Rooke, Hine, & Thorsteinsson, 2008), including behavior toward specific groups (see Greenwald, Poehlman, Uhlmann, & Banaji, 2009; Oswald, Mitchell, Blanton, Jaccard, & Tetlock, 2013), there is limited research on this relationship as it relates to sexual behavior (e.g., Jellison, McConnell, & Gabriel, 2004; Marsh, Johnson, & Scott-Sheldon, 2001). To date, the relationship between implicit attitudes toward BDSM (bondage and discipline/dominance and submission/sadism and masochism) and behavior toward a person identified as practicing BDSM is largely unstudied. Of particular social significance is the behavior of psychologists and other helping professionals in clinical settings toward their clients, who may belong to groups holding marginalized and/or uncommon identities or practices. The purpose of the current study was to explore the relationship between implicit attitudes, explicit attitudes, and overt social behavior of current and future clinical psychologists within a contrived experimental setting using the IRAP, several questionnaires, and a contrived interviewing task with two confederates, one
