3. Brian bought the lottery ticket, but he didn't know that it would change his life. He bought it on a whim. He went to his job. He worked for his boss. He drove home. He loved his family. He lived his life. Then the news came on TV.

What will happen by the end of the story?

4. "Armando, don't get your new shoes muddy!" Mom yelled at him as he left. "Ok Mom!" Armando hopped and skipped to the bus. Armando always did what his mom told him to do. The clouds gathered in the distance.

What will happen by the end of the story?

5. "We've got to have rules and obey them. After all, we're not savages. We're English, and the English are best at everything."

Artificial Intelligence & Games Georgi Togeli,2024-09-03 As has been pointed out by several industrial game AI developers the lack of behavioral modularity across games and in game tasks is detrimental for the development of high quality AI 605 171 An increasingly popular method for ad hoc behavior authoring that eliminates the modularity limitations of FSMs and BTs is the utility based AI approach which can be used for the design of control and decision making systems in games 425 557 Following this approach instances in the game get assigned a particular utility function that gives a value for the importance of the particular instance 10 169 For instance the importance of an enemy

being present at a particular distance or the importance of an agent's health being low in this particular context. Given the set of all utilities available to an agent and all the options it has, utility-based AI decides which is the most important option it should consider at this moment.

426 The utility-based approach is grounded in the utility theory of economics and is based on utility function design. The approach is similar to the design of membership functions in a fuzzy set. A utility can measure anything from observable objective data (e.g., enemy health) to subjective notions such as emotions, mood, and threat. The various utilities about possible actions or decisions can be aggregated into linear or non-linear formulas and guide the agent to take decisions based on the aggregated utility. The utility values can be checked every n frames of the game. So while FSMs and BTs would examine one decision at a time, utility-based AI architectures
