Entropy Based Fatigue, Fracture, Failure Prediction and Structural Health Monitoring Cemal Basaran, 2021-01-13 Traditionally fatigue fracture damage mechanics are predictions are based on empirical curve fitting models based on experimental data However when entropy is used as the metric for degradation of the material the modeling process becomes physics based rather than empirical modeling Because entropy generation in a material can be calculated from the fundamental equation of the material This collection of manuscripts is about using entropy for Fatigue Fracture Failure Prediction and Structural Health Monitoring The theoretical paper in the collection provides the mathematical and physics framework behind the unified mechanics theory which unifies universal laws of

motion of Newton and laws of thermodynamics at ab initio level Unified Mechanics introduces an additional axis called Thermodynamic State Index axis which is linearly independent from Newtonian space $x y z$ and time As a result derivative of displacement with respect to entropy is not zero in unified mechanics theory as in Newtonian mechanics Any material is treated as a thermodynamic system and fundamental equation of the material is derived Fundamental equation defines entropy generation rate in the system Experimental papers in the collection prove validity of using entropy as a stable metric for Fatigue Fracture Failure Prediction and Structural Health Monitoring

Elements of Strength of Materials Dr. I.S.N.V.R. Prasanth, Er. Ramineni Surendra Babu, Dr. G.Vani,Er. R.Saleema Begum, The study of the response of solid objects when they are subjected to stresses and strains is known as the strength of materials which is sometimes referred to as the mechanics of materials Material strength is defined as the point on the engineering stress strain curve known as the yield stress which is the point beyond which the material undergoes deformations that will not be entirely reversed upon removal of the loading As a consequence the member will have a deflection that is permanent The point on the engineering stress strain curve that corresponds to the stress that causes a material to fracture is known as the ultimate strength of the material Strength of materials often known as the mechanics of materials is a discipline that primarily relates to the many techniques of estimating the stresses and strains in structural components like beams columns and shafts The techniques that are used to anticipate the reaction of a structure under loading and its susceptibility to different failure modes take into consideration the characteristics of the materials such as the yield strength ultimate strength Young modulus and Poisson ratio of the material This ensures that an accurate prediction can be made In addition one must take into account the macroscopic qualities geometric properties of the mechanical element These include the element length breadth thickness boundary limitations and sudden changes in geometry such as holes
