

How Do Electromagnetic Waves Propagate Through Different Media?

- Electromagnetic waves propagate through various media - vacuum, air, solid materials, and their behavior changes accordingly
- In a vacuum, they travel at the speed of light without any hindrances, while in air, they scatter, absorb, or refract due to air molecules, albeit maintaining a speed close to that in a vacuum
- Transparent media like water or glass cause the waves to bend or refract due to changes in speed, dictated by the medium's index of refraction
- In conductive materials, such as metals, the waves interact with free electrons and are largely absorbed, converting into heat
- Lossy dielectric media, like soil or human tissue, absorb and attenuate these waves, significantly affecting their strength
