Prior Knowledge Question (Do this BEFORE using the Gizmo.)

In many science fiction movies, an evil alien spaceship explodes with an enormous KABOOM!!

Suppose you were floating in space at a safe distance from a large explosion such as the supernova at left. Do you think you would hear anything? Explain.

I don't think so, the sound doesn't have anything to vibrate to make the noise in space.

Sound waves require a **medium**, such as air, to travel through. Sound waves are examples of **longitudinal waves**, or waves in which particles move back and forth in the same direction as the wave.

You can use the *Longitudinal Waves* Gizmo to explore the behavior of sound waves. In the Gizmo, an air-filled tube contains 24 evenly-spaced, airtight dividers. To begin, select the **Pulsed waves** setting and the **Open tube**. Set the **Strength** to 1.00. Deselect the graph options at lower right.

1. Click **Play** (▶) to set off the firecracker by the left end of the tube. What do you see? The wave moves left and right and then back. Also, it also dips below 0 on the second round and every other one after.
2. Do any individual air molecules travel the length of the tube? I think they do.

How do you know? The airtight dividers didn't block the air molecules from travelling through.
