Artificial Neural Nets and Genetic Algorithms George D. Smith, Nigel C. Steele, Rudolf F. Albrecht, 2012-12-06 This is the third in a series of conferences devoted primarily to the theory and applications of artificial neural networks and genetic algorithms The first such event was held in Innsbruck Austria in April 1993 the second in Ales France in April 1995 We are pleased to host the 1997 event in the mediaeval city of Norwich England and to carry on the fine tradition set by its predecessors of providing a relaxed and stimulating environment for both established and emerging researchers working in these and other related fields This series of conferences is unique in recognising the relation between the two main themes of artificial neural networks and genetic algorithms each having its origin in a natural process fundamental to life on earth and each now well established as a paradigm fundamental to continuing technological development through the solution of complex industrial commercial and financial problems This is well illustrated in this volume by the numerous applications of both paradigms to new and challenging problems The third key theme of the series therefore is the integration of both technologies either through the use of the genetic algorithm to construct the most effective network architecture for the problem in hand or more recently the use of neural networks as approximate fitness functions for a genetic algorithm searching for good solutions in an incomplete solution space i e one for which the fitness is not easily established for every possible solution instance

Genetic Engineering of Symbiotic Nitrogen Fixation and Conservation of Fixed Nitrogen J. M. Lyons, 2012-12-06 The present volume developed from a symposium entitled Enhancing Biological Production of Ammonia From Atmospheric Nitrogen and Soil Nitrate that was held at Lake Tahoe California in June 1980 The meeting was supported by the National Science Foundation Division of Engineering and Applied Sciences and by the College of Agricultural and Environmental Sciences University of California Davis A total of 99 scientists from 41 institutions participated Plants capture solar energy in photosynthesis and use mineral nutrients to produce human food and fiber products The extent to which such materials are removed from agricultural production sites represents a permanent drain of mineral nutrients Some plants of agronomic importance such as alfalfa soybean and clover associate with soil bacteria and use photosynthetic energy to reduce N_2 to NH_3 Many other free living bacteria and some symbioses involving procaryotes and eucaryotes also reduce N_2 Such processes represent one natural mechanism by which Man can augment soil N for agronomic purposes without using fossil fuel to synthesize and distribute N fertilizer Other metabolic conversions in the N cycle and physical leaching processes remove N made available through N_2 fixation Thus nitrification denitrification and utilization of soil N by plants are processes that must be considered if one is to conserve N

captured by N2 fixation The meeting at Lake Tahoe united scientists from many disciplines to review the literature and to discuss current research directed toward the goal stated in the symposium title *Cumulated Index Medicus*, 2000
