Logic Circuit Simplification

Objectives

After completing this experiment, you will be able to

- Develop the truth table for a BCD invalid code detector.
- Use a Karnaugh map to simplify the expression.
- Build and test a circuit that implements the simplified expression.
- Predict the effect of "faults" in the circuit.

Materials Needed

7400 NAND gate
LED
Resistors: one 330 Ω , four 1.0 k Ω
One 4-position DIP switch

Summary of Theory

With combinational logic circuits, the outputs are determined solely by the inputs. For simple combinational circuits, truth tables are used to summarize all possible inputs and outputs; the truth table completely describes the desired operation of the circuit. The circuit may be realized by simplifying the expression for the output function as read from the truth table.

A powerful mapping technique for simplifying combinational logic circuits was developed by M. Karnaugh and was described in a paper he published

in 1953. The method involved writing the truth table into a geometric map in which adjacent cells (squares) differ from each other in only one variable. (Adjacent cells share a common border horizontally or vertically.) When you are drawing a Karnaugh map, the variables are written in a Gray code sequence along the sides and tops of the map. Each cell on the map corresponds to one row of the truth table. The output variables appear as 0's and 1's on the map in positions corresponding to those given in the truth table.

As an example, consider the design of a 2-bit comparator. The inputs will be called A_2A_1 and B_2B_1 . The desired output is HIGH if A_2A_1 is equal to or greater than B_2B_1 . To begin, the desired output is written in the form of a truth table, as given in Table 8-1. All possible inputs are clearly identified by the truth table and the desired output for every possible input is given.

Next the Karnaugh map is drawn, as shown in Figure 8-1. In this example, the map is drawn using numbers to represent the inputs. The corresponding values for the output function are entered from the truth table. The map can be read in sum-of-products (SOP) form by grouping adjacent cells containing 1's on the map. The size of the groups must be an integer power of 2 (1, 2, 4, 8, etc.) and should contain only 1's. The largest possible group should be taken; all 1's must be in at least one group and may be taken in more than one group if helpful.

After grouping the 1's on the map, the output function can be determined. Each group is read as

Scalable Techniques for Formal Verification Sandip Ray,2010-06-17 This book is about formal verification that is the use of mathematical reasoning to ensure correct execution of computing systems With the increasing use of computing systems in safety critical and security critical applications it is becoming increasingly important for our well being to ensure that those systems execute correctly Over the last decade formal verification has made significant headway in the analysis of industrial systems particularly in the realm of verification of hardware A key advantage of formal verification is that it provides a mathematical guarantee of their correctness up to the accuracy of formal models and correctness of reasoning tools In the process the analysis can expose subtle design errors Formal verification is particularly effective in finding corner case bugs that are difficult to detect through traditional simulation and testing Nevertheless and in spite of its promise the application of formal verification has so far been limited in an industrial design validation tool flow The difficulties in its large scale adoption include the following 1 deductive verification using theorem provers often involves excessive and prohibitive manual effort and 2 automated decision procedures e.g model checking can quickly hit the bounds of available time and memory This book presents recent advances in formal verification techniques and discusses the applicability of the techniques in ensuring the reliability of large scale systems We deal with the verification of a range of computing systems from sequential programs to concurrent protocols and pipelined machines **Energy Research Abstracts** ,1992-12 *Nuclear Science Abstracts* ,1964
