1. Introduction

The present document is the result of the coordination of a group of international specialists in the field of room acoustics, and contains the experiences and suggestions of its members on the procedures of measurement inside historical opera houses. The final objective of the action is to elaborate a complete methodology which might start with the measurement of raw acoustical data according with the state-of-the-art techniques and end with the definition/selection of the suitable parameters to fully describe the acoustic field inside these places.

The following points will focus the whole procedure into:

- 1) Definition of the measurement procedures, regarding the setup of the theatre and the positions of sound sources and receivers;
- 2) Choice of measurement methodology and of the measurement chain;
- 3) Definition of a set of objective acoustical parameters;
- 4) Definition of the criteria for cataloguing and presenting the results.

The document, at the present stage, will then treat steps number one and two since the remaining are still under discussion.

The procedures indicated in the next paragraphs are partly well established and partly only recently proposed. The guidelines are undergoing a validation procedure in dedicated sessions of measurements.

2. Measurement procedures

The most important normative reference for measurements of the kind here considered is the norm ISO3382[2]; the present procedures integrate the norm in some respects and specialize the approach to historical theatres. The goal of the campaign is to characterize the theatres for the destination they were conceived for, that is for executions of opera even if, as known, they currently house different kinds of events like symphonic and small ensemble concerts or recitals.

2.1 Setups of the opera house

To characterize the theatre for opera it is necessary to investigate three systems: the hall (which contains the audience subdivided into stalls, boxes and gallery), the stage (where the action takes place) and the third system which is the sum of both the stage and the hall. The importance of the acoustics of the stage has been underlined by many authors (as in [3] and [4]) and is common experience of the performers, especially if singers, who know all acoustical merits and faults of the stage due to their familiarity to this place.

The three systems can be described, from the acoustical point of view, considering two setups of the theatre, which will be prepared before the measurements take place and will be maintained during the session. A brief description of the two setups can be as follows:

- A. Hall and stage coupled: the orchestra pit, which can be found in almost all the historical theatres, is lowered in the configuration usually employed for opera. The stage is in the full length and does not contain any scenery. To simulate the
