

Chemical Equilibrium

NAME _____ DATE _____

Introduction

Chemical equilibrium is a state in which the concentrations of reactants and products remain constant over time. This occurs when the forward and reverse reaction rates are equal.

Le Chatelier's Principle states that if a system at equilibrium is subjected to a change in concentration, temperature, or pressure, the system will shift to counteract the change.

For example, if the concentration of a reactant is increased, the system will shift to the right to produce more products and reduce the concentration of the reactant.

Temperature changes also affect equilibrium. For an exothermic reaction, increasing the temperature will shift the equilibrium to the left, favoring the reactants.

Pressure changes affect equilibrium only for reactions involving gases. Increasing the pressure will shift the equilibrium towards the side with fewer moles of gas.

Understanding chemical equilibrium is essential for predicting the behavior of chemical systems under various conditions and for optimizing industrial processes.

This document provides a comprehensive overview of chemical equilibrium, including the principles governing it and the factors that influence its position.

By studying this material, you will gain a deeper understanding of the dynamic nature of chemical systems at equilibrium.
