1 Background

Receptor proteins are ubiquitous in the plasma membrane of mammalian cells, which transduce information about cellular environment to intracellular signaling networks Vaquerizas et al (2009); Yosef et al (2009); Purvis and Lahav (2013). There are approximately 1352 receptor proteins coded by human genome Almén et al (2009). The flow of information through those receptors is critically shaped by receptor interactions. The diverse cellular processes regulated by such receptor proteins include cell growth and division, differentiation, migration, and apoptosis Schlessinger (2000). Receptor signaling dysregulation is attributed to the pathogenesis of several diseases Gschwind et al (2004); Mendelsohn and Baselga (2000). Therefore, understanding the interactions, molecular processes and relevant structures of such signaling receptors is imperative.

Human receptor proteins, including the epidermal growth factor receptor (EGFR), share a common molecular architecture, consisting of an extracellular binding domain, a single transmembrane helix, a flexible juxtamembrane segment, and an intracellular tyrosine kinase domain Citri and Yarden (2006). Ligand binding to the extracellular domains induces conformational reorganization that promotes receptor dimerization, leading to the activation of the intracellular tyrosine kinase domain. However, conclusions about the mechanism of ligand-induced dynamic recruitment and dimerization of membrane-associated receptors remains controversial Kusumi et al (2012). Conventional steady-state ensemble approaches cannot be used to address the stochastic nature of activated receptors that encounter each other in a highly heterogeneous and fluidic plasma membrane. Recent advancements in single-molecule fluorescent imaging and tracking have provided further insights into the behavior of EGFR in vivo Teramura et al (2006); Chung et al (2010); Hiroshimaa et al (2012). For example, Lidke et al. devised a two-color quantum-dot tracking method to visualize the state-dependent dimerization processes of human EGFR in living cells Low-Nam et al (2011). A hidden Markov model was used to extract the kinetic parameters of the underlying free, co-confined, and dimerized states.

Nature Journal Submission Guidelines:

Adopting the Track of Term: An Mental Symphony within **Nature Journal Submission Guidelines**

In some sort of eaten by displays and the ceaseless chatter of instant transmission, the melodic beauty and mental symphony developed by the published term frequently fade in to the back ground, eclipsed by the relentless noise and distractions that permeate our lives. But, located within the pages of **Nature Journal Submission Guidelines** a charming literary prize brimming with raw feelings, lies an immersive symphony waiting to be embraced. Crafted by an elegant musician of language, that interesting masterpiece conducts visitors on a psychological journey, well unraveling the concealed songs and profound affect resonating within each carefully crafted phrase. Within the depths with this poignant review, we shall explore the book is main harmonies, analyze its enthralling writing style, and surrender ourselves to the profound resonance that echoes in the depths of readers souls.
