Carroll, Elyn Rykken, 2018-12-20 Geometry The Line and the Circle is an undergraduate text with a strong narrative that is written at the appropriate level of rigor for an upper level survey or axiomatic course in geometry Starting with Euclid's Elements the book connects topics in Euclidean and non Euclidean geometry in an intentional and meaningful way with historical context The line and the circle are the principal characters driving the narrative In every geometry considered which include spherical hyperbolic and taxicab as well as finite affine and projective geometries these two objects are analyzed and highlighted Along the way the reader contemplates fundamental questions such as What is a straight line What does parallel mean What is distance What is area There is a strong focus on axiomatic structures throughout the text While Euclid is a constant inspiration and the Elements is repeatedly revisited with substantial coverage of Books I II III IV and VI non Euclidean geometries are introduced very early to give the reader perspective on questions of axiomatics Rounding out the thorough coverage of axiomatics are concluding chapters on transformations and constructibility The book is compulsively readable with great attention paid to the historical narrative and hundreds of attractive problems *Solutions of the exercises in [H.M.] Taylor's Euclid ... books i-iv (vi-xi).* William Wilberforce Taylor, 1897 **Geometry of Curves and Surfaces with MAPLE** Vladimir Rovenski, 2013-12-01 This concise text on geometry with computer modeling presents some elementary methods for analytical modeling and visualization of curves and surfaces The author systematically examines such powerful tools as 2 D and 3 D animation of geometric images transformations shadows and colors and then further studies more complex problems in differential geometry Well illustrated with more than 350 figures reproducible using Maple programs in the book the work is devoted to three main areas curves surfaces and polyhedra Pedagogical benefits can be found in the large number of Maple programs some of which are analogous to C programs including those for splines and fractals To avoid tedious typing readers will be able to download many of the programs from the Birkhauser web site Aimed at a broad audience of students instructors of mathematics computer scientists and engineers who have knowledge of analytical geometry i.e. method of coordinates this text will be an excellent classroom resource or self study reference With over 100 stimulating exercises problems and solutions it Geometry of Curves and Surfaces with Maple will integrate traditional differential and non Euclidean geometries with more current computer algebra systems in a practical and user friendly format The Real Projective Plane H.S.M. Coxeter, 2012-12-06 Along with many small improvements this revised edition contains van Yzeren's new proof of Pascal's theorem 1.7 and in Chapter 2 an improved treatment of order and sense The Sylvester Gallai theorem instead of being

introduced as a curiosity is now used as an essential step in the theory of harmonic separation 3 34 This makes the logical development self contained the footnotes involving the References pp 214 216 are for comparison with earlier treatments and to give credit where it is due not to fill gaps in the argument H S M C November 1992 v Preface to the Second Edition Why should one study the real plane To this question put by those who advocate the complex plane or geometry over a general field I would reply that the real plane is an easy first step Most of the properties are closely analogous and the real field has the advantage of intuitive accessibility Moreover real geometry is exactly what is needed for the projective approach to non Euclidean geometry Instead of introducing the affine and Euclidean metrics as in Chapters 8 and 9 we could just as well take the locus of points at infinity to be a conic or replace the absolute involution by an absolute polarity **Basic**
