Gizmo Warm-up

Have you ever wondered what is in your food? Scientists use a variety of tests to determine the nutritional content of food. You will learn four of those tests with the *Identifying Nutrients* Gizmo.

- Below the **Food samples** label, drag tube **A** into the **Food sample holder**. Below the **Benedict test**, click the **Test** button. What is done in the Benedict test?

Is used to test the presence of monosaccharides.

- The Benedict test is a test for **monosaccharides**; simple sugars like glucose or fructose (fruit sugar). In contact with monosaccharides, the Benedict solution turns from blue to green to orange.

Does **Sample A** contain monosaccharides? Yes

Note: **Disaccharides** such as sucrose (table sugar) and lactose (milk sugar) are more complex than monosaccharides. The Benedict test does not detect disaccharides directly.

Get the Gizmo ready:

- Click **Reset**.
- Drag **Sample A** into the **Food sample holder**.

Introduction: Most food is composed of three types of molecules: **carbohydrates**, **proteins**, and **lipids**.

- Carbohydrates such as **starches** and sugars are major source of energy. Simple sugars are found in sweets and fruits. Starches are found in potatoes, cereal, pasta, flour, and other plant products.
- Proteins are used in body structures such as muscles, skin, and hair. Rich sources of proteins include meats, dairy products, and beans.
- Lipids (fats and oils) are used for energy, insulation, and as an essential building block of cells. Meats, dairy products, and oily plants such as olives are rich in lipids.

Guiding Principles for Developing Dietary Reference Intakes Based on Chronic Disease National Academies of Sciences, Engineering, and Medicine, Health and Medicine Division, Food and Nutrition Board, Committee on the Development of Guiding Principles for the Inclusion of Chronic Disease Endpoints in Future Dietary Reference Intakes, 2017-11-21 Since 1938 and 1941 nutrient intake recommendations have been issued to the public in Canada and the United States respectively. Currently defined as the Dietary Reference Intakes (DRIs), these values are a set of standards established by consensus committees under the National Academies of Sciences Engineering and Medicine and used for planning and assessing diets of apparently healthy individuals and groups. In 2015 a multidisciplinary working group sponsored by the Canadian and U.S. government DRI steering committees convened to identify key scientific challenges encountered in the use of chronic disease endpoints to establish DRI values. Their report, *Options for Basing Dietary Reference Intakes (DRIs) on Chronic Disease*, Report from a Joint US Canadian Sponsored Working Group outlined and proposed ways to address conceptual and methodological challenges related to the work of future DRI Committees. This report assesses the options presented in the previous report and determines guiding principles for including chronic disease endpoints for food substances that will be used by future National Academies committees in establishing DRIs.

Seeding the Universe with Life: Securing Our Cosmological Future Michael Noah Mautner, 2000

It is the human purpose to propagate Life. In this popular science title, a well-recognized researcher describes how we can seed new solar systems with microbial representatives of our family of organic life. The book also describes a life-centered astroethics that will motivate these missions based on the unity of all gene/protein/life, a common ancestry, a unique complexity, and the coincidence of physical laws that allow biology, giving life a special place in Nature, a shared drive for survival and procreation, and a shared future. As part of this family, it is our purpose to safeguard and expand life in the universe. To advance this purpose, Professor Mautner pioneered research on the fertilities of extra-terrestrial materials in asteroids/meteorites. The results show that many microorganisms and even plants can grow on resources found commonly in space, which are basically similar to Earth materials. The conclusions are significant: If life can flourish on Earth, life can flourish throughout the universe. Based on the results on microbes and meteorites, the author estimates the ultimate amounts of life that our missions can induce in the cosmological future. A life-centered astroethics can assure that our descendants will be there to enjoy this future.
