

The background of the cover is a vibrant blue sky with scattered white clouds. A bright, glowing light source, possibly the sun, is positioned on the left side, creating a strong lens flare effect that radiates across the sky. A dark-colored fighter jet is shown in profile, flying from left to right across the center of the image. The jet's wings are swept back, and it appears to be in a high-speed maneuver.

Computational Fluid Dynamics John Wendt, 2008-11-04 Computational Fluid Dynamics An Introduction grew out of a von Karman Institute VKI Lecture Series by the same title first presented in 1985 and repeated with modifications every year since that time The objective then and now was to present the subject of computational fluid dynamics CFD to an audience unfamiliar with all but the most basic numerical techniques and to do so in such a way that the practical application of CFD would become clear to everyone A second edition appeared in 1995 with updates to all the chapters and when that printing came to an end the publisher requested that the editor and authors consider the preparation of a third edition Happily the authors received the request with enthusiasm The third edition has the goal of presenting additional updates and clarifications while preserving the introductory nature of the material The book is divided into three parts John Anderson lays out the subject in Part I by first describing the governing equations of fluid dynamics concentrating on their mathematical properties which contain the keys

to the choice of the numerical approach Methods of discretizing the equations are discussed and transformation techniques and grids are presented Two examples of numerical methods close out this part of the book source and vortex panel methods and the explicit method Part II is devoted to four self contained chapters on more advanced material Roger Grundmann treats the boundary layer equations and methods of solution

Biological Fluid Dynamics: Modeling, Computations, and Applications Anita T. Layton, Sarah D. Olson, 2014-10-14 This volume contains the Proceedings of the AMS Special Session on Biological Fluid Dynamics Modeling Computation and Applications held on October 13 2012 at Tulane University New Orleans Louisiana In recent years there has been increasing interest in the development and application of advanced computational techniques for simulating fluid motion driven by immersed flexible structures That interest is motivated in large part by the multitude of applications in physiology and biology In some biological systems fluid motion is driven by active biological tissues which are typically constructed of fibers that are surrounded by fluid Not only do the fibers hold the tissues together they also transmit forces that ultimately result in fluid motion In other examples the fluid may flow through conduits such as blood vessels or airways that are flexible or active That is those conduits may react to and affect the fluid dynamics This volume responds to the widespread interest among mathematicians biologists and engineers in fluid structure interactions problems Included are expository and review articles in biological fluid dynamics Applications that are considered include ciliary motion upside down jellyfish biological feedback in the kidney peristalsis and dynamic suction pumping and platelet cohesion and adhesion
