Name \_\_\_\_\_

Label the parts of the human urinary system, including the human kidney, in the diagram below. Give the function/purpose of each part.

- kidneys removes nitrogens, salts, & water from blood
- adrenal glands produce epinephrine & norepinephrine
- ureter drains kidney into the bladder
- urinary bladder Stores urine until it can be released
- urethra drains urinary bladder to
- renal artery Artery leading to kidneys - brings "dirty" blood
- renal vein vein leading away from kidney - removes "clean" blood
- cortex outer layer of kidney
- medulla inner layer of kidney - contains many nephrons
- renal pelvis drains each nephron - central area, collects urine

Fill in the blanks below with the correct answers.

Kidneys are the "filters" of the excretory system. They control essential balance between body salts and water. They remove from the blood nitrogenous wastes, water, urea, nonvolatile foreign substances, excess salt and excess water. The kidney is enclosed by a connective tissue capsule and is divided into an outer cortex and an inner medulla. The Loop of Henle functions chiefly for water resorption. The liquid waste, urine, collected by the kidneys passes through the ureter to the urinary bladder. Urinary bladder is a strong muscular organ that stores the urine until it can be excreted via the urethra.

Gardner, Michelle Lane, Andrew J. Watson, 2004-01-08 This book pulls together the full range of cell culture biochemical microscopic and genetic techniques to study the early mammalian embryo Until now there has never been such a comprehensive compendium though there have been more focused books of protocol such as *Manipulating the Mouse Embryo* from Cold Spring Harbor This book is intended to appeal to all constituencies from basic experimental science to clinical and animal science applications **Text-book of the embryology of man and mammals**

Gwatkin, 2013-11-11 Developmental biology has been transformed recently by discoveries in the fields of molecular biology cell biology and immunology New ways of manipulating mammalian development are uncovering control mechanisms and enabling us to apply them in solving practical problems in animal production and human health This book outlines some of these new manipulations and how they have contributed to the present state of developmental biology Chapter 1 describes gene transfer by micro injection of cloned recombinant DNA into zygotes Although the factors that affect transformation frequencies and integration sites are still unknown such techniques offer a number of exciting prospects Research models for human disease could be artificially created and desirable characteristics in agricultural animals could be hanced The theme of cell to cell transfer is continued in Chapters 2 and 3 Chapter 2 describes pronuclear transplantation by Sendai virus induced fusion of the karyoplast with the enucleated embryo Using this procedure it has been demonstrated that both male and female genomes are essential for normal development although the reason for this is not yet understood Chapter 3 describes studies on the fusion of whole oocytes **Experimental Approaches to Mammalian Embryonic Development** Janet Rossant, Roger A.

Sherman, 1977-01 This volume the first in the MIT Cell Monograph Series offers a thorough overview of a few selected topics in mammalian embryogenesis that are of current interest and interrelate well with each other Most of the studies described deal with the mouse embryo since laboratory maintenance of mice is convenient and the genetics of the mouse are well established One of the underlying themes throughout the chapters is the programming of events in early embryogenesis The activation of however embryologists have yet to explain how the microenvironment can trigger a cell to embark on a specific course of differentiation Various methods used in investigating this problem and a chapter on the possible role of viruses in the control of embryonic development completes the volume In summary the editor states the chapters in this monograph demonstrate that mammalian embryologists are now equipped with morphological biochemical and molecular biological markers of early embryonic development and differentiation Model systems are available for testing ideas of genetic and epigenetic control mechanisms With proper use of these resources our understanding of mammalian embryogenesis could be revolutionized within the next decade
