

Group 35 GOVERNOR

DESCRIPTION

When the fuel applied to a motor continuously varies, a governor is necessary to regulate engine to maintain uniform engine speed. The governor accomplishes this by changing power supplied to cylinder in accordance with loads applied to shaft. For effective control, the governor must not only vary immediately the power output of engine, but must also be sensitive to changes in engine speed. The action of a governor must be smooth, without "hunting" or erratic action.

The Model "M" Taurus is equipped with a gear-driven, centrifugal flyweight type governor having two weights mounted on a single carrier which is rigidly fixed to governor shaft. The governor operates on the "throttle transfer" of governing. Changing the relative position of reference throttle fly changes amount of fuel and air mixture going into cylinder of engine. As gov-

ernor is throttle control lever so that governor will maintain any engine speed up to throttle control lever, when engine is controlled.

Normal operation of the engine demands largely upon proper operation of governor. The Model "M" governor is specifically designed to give low governing performance between speeds of 1800 R.P.M. full load rated engine speed and over 3000 R.P.M. full load.

The control of fuel and air mixture, which is supplied to engine, produces the desired power and speed change of engine under varying loads. The governor is
