Grondzik,2007 The Air Conditioning Manual assists entry level engineers in the design of air conditioning systems It is also usable in conjunction with fundamental HVAC R resource material as a senior or graduate level text for a university course in HVAC system design The manual was written to fill the void between theory and practice to bridge the gap between real world design practices and the theoretical calculations and analytical procedures or on the design of components This second edition represents an update and revision of the manual It now features the use of SI units throughout updated references and the editing of many illustrations Helps engineers quickly come up with a design solution to a required air conditioning system Includes issues from comfort to cooling load calculations New sections on Green HVAC systems deal with hot topic of sustainable buildings

*A Manual of Heating and Ventilation* F. Schumann,2013-12 An excerpt from the beginning of the first chapter GENERAL PRINCIPLES HOT WATER apparatus where the temperature in the boiler does not exceed 212 should be adopted for buildings occupied continuously and where steam from power boilers is not available for instance Schools Court rooms Hospitals and Dwellings steam on the other hand for Churches Theatres Public Halls occupied at intervals and such other buildings where steam is used as power and the application of the waste for heating purposes is practicable The choice of Direct or Indirect radiation will depend on the construction of the building and on the purposes for which it is intended It is sometimes impossible to obtain sufficient space in walls for heating flues or it may be objectionable to supply the radiators in the cellar or basement with air that might be contaminated by being taken from near the sidewalk or damp and unclean areas when it would be an easy matter to supply direct radiators through openings in window breasts on the other hand direct radiators in a room may interfere with the decorations or it may be difficult to supply the fresh air Direct radiation is the most economical for the reason that radiant heat is utilized while in indirect radiation it is partially lost DIRECT RADIATION In direct radiation the coils or radiators are placed in the room if possible on the coldest side they are intended to warm the fresh air being conveyed to them through flues to the lowest part of the coils the flow of air being regulated by a damper The fresh air is heated by contact with the radiators the surrounding walls and solid objects absorbing a certain amount of radiant heat and

again heating the air by contact Radiant heat does not heat the air through which it passes to any appreciable extent The intensity of heat emitted by a plane surface decreases with the sine of the angle formed between the direction of the rays and the surface at the point of emission therefore circular surfaces are more effectual than plane ones INDIRECT RADIATION In indirect radiation the coils or radiators are placed in other rooms than those they are intended to heat generally the basement or cellar as at radiator the fresh air being conveyed to them through flues or ducts and heated by contact and thence through flues or ducts F into the various rooms the quantity of cold air being regulated by dampers The walls and solid objects in the rooms are heated by contact with the warmed air only HVAC Principles and Applications Manual Thomas E.
