Hierarchical Modeling for VLSI Circuit Testing Debashis Bhattacharya, John P. Hayes, 2012-12-06 Test generation is one of the most difficult tasks facing the designer of complex VLSI based digital systems Much of this difficulty is attributable to the almost universal use in testing of low gate level circuit and fault models that predate integrated circuit technology It is long been recognized that the testing problem can be alleviated by the use of higher level methods in which multigate modules or cells are the primitive components in test generation however the development of such methods has proceeded very slowly To be acceptable high level approaches should be applicable to most types of digital circuits and

should provide fault coverage comparable to that of traditional low level methods The fault coverage problem has perhaps been the most intractable due to continued reliance in the testing industry on the single stuck line SSL fault model which is tightly bound to the gate level of abstraction This monograph presents a novel approach to solving the foregoing problem It is based on the systematic use of multibit vectors rather than single bits to represent logic signals including fault signals A circuit is viewed as a collection of high level components such as adders multiplexers and registers interconnected by n bit buses To match this high level circuit model we introduce a high level bus fault that in effect replaces a large number of SSL faults and allows them to be tested in parallel However by reducing the bus size from n to one we can obtain the traditional gate level circuit and models
