FIG. 1. Schematic representation of the proposed model for the development of the human brain. The model is based on the assumption that the brain is a complex system of interacting components, each of which is represented by a node in the network. The nodes are interconnected by a set of edges, which represent the connections between the components. The model is designed to simulate the development of the brain from a simple initial state to a complex, fully developed state. The development is driven by a set of parameters, which are adjusted to match the observed data. The model is able to predict the behavior of the brain at different stages of development, and it can be used to study the effects of various factors on brain development.
