

12.2 Check the bolts for signs of wear like those. If it looks worn, replace it.

expensive. For a faster charge, you can use a higher amperage charger, but don't use one rated more than 1/10th the amp-hour rating of the battery. Higher amperage chargers that claim to restore the power of the battery in one to two hours are based on the battery and can damage batteries not in good condition. The type of charging should only be used in emergency situations.

11. The average time necessary to charge a battery should be listed in the instructions that come with the charger. As a general rule, a water-charged cell charges a battery in 12 to 16 hours.

12. Remove all the cell caps (if equipped) and cover the holes with a clean cloth to prevent splashing electrolyte. Reconnect the negative battery cable and hook the battery charger cable across up to the battery post opposite in position. Negative to negative; then plug in the charger. Make sure it is set at 15 volts if it has a voltage switch.

13. If you're using a charger with a rate higher than two amps, check the battery regularly during charging to make sure it doesn't overheat. If you're using a three-amp charger, you can safely let the battery charge overnight after you've checked it regularly for the first couple of hours.

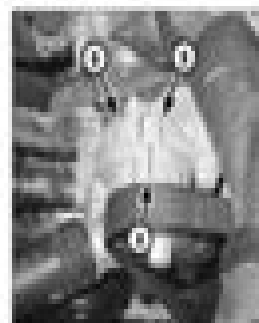

14. If the battery has electrolyte cell caps, remove the specific gravity with a hydrometer soon after the last few hours of the charging cycle. Hydrometers are available inexpensively from auto parts stores. Follow the instructions that come with the hydrometer. Consider the battery charged when there's no change in the specific gravity reading for two hours with the electrolyte in the cells is showing stabilizing levels. The specific gravity reading from each cell should be very close to

the others. If not, the battery probably has a bad cell.

15. Some batteries with sealed tops have built-in hydrometers on the top that indicate the state-of-charge by the color treatment in the hydrometer window. Normally, a light-colored hydrometer indicates a full charge and a dark hydrometer indicates the battery still needs charging.

16. If the battery has a sealed top and no built-in hydrometer, you can hook up a digital voltmeter across the battery terminals to check the charge. A fully charged battery should read 12.7 volts or higher.

17. Further information on the battery and jump-starting can be found in Chapter 3 and in the back of this manual.

12.4a The crack (A) on the main bolt's terminal must extend between the marks (B) on the terminal mount (B) above, main bolt.

## 12.5 Detailed check, adjustment and replacement every 6000 miles or 6 months

Refer to illustrations 12.5, 12.6a, 12.6b, 12.6c, 12.6d and 12.6e

1. A serpentine belt is located at the front of the engine and plays an important role in the overall operation of the engine and its components. Due to its function and material make-up, the belt system is wear and should be periodically inspected. The serpentine belt drives the alternator, power steering pump, water pump and air conditioning compressor. Note: All models have one belt. Information here can apply both and a second, over-the-top for the air conditioning compressor (if equipped).

2. With the engine off, open the hood and use your fingers (and a flashlight, if necessary) to move along the belt checking for cracks and separation of the belt plies. Also check for fraying and glazing, which gives the belt a shiny appearance (see illustration). Both sides of the belt should be inspected, which means you will have to bend the belt to check the underside.

3. Check the underside of the belt. They should lie at the same depth, with none of the surface cracked.

4. The tension of the belt is maintained by a spring-loaded tensioner assembly and isn't adjustable. The belt should be replaced when the mark on the movable part of the tensioner moves out of the acceptable range or lies on the stationary part of the tensioner (see illustration).

5. To replace the belt, slide the tensioner to release belt tension (see illustration). Note: Before removing the belt, make a note of how it is routed around the pulleys. If you don't know you can replace it.

6. Remove the belt from the tensioner and routing components are ready to install the tensioner.

12.6a The tensioner for the air conditioning compressor (indicated) is similar to one. The mark (A) on the movable part of the tensioner must lie within the acceptable range mark (B).

12.6b Place a thumb on the tensioner belt (A) and have the tensioner structure (B) be bent outward.

12.6c On V6 models with an air conditioning, the main belt tensioner is bent outward from below. Use a 1/4 inch drive bar in the tensioner's square hole (A) to rotate it (B) for belt removal.

7. Slide the new belt over the various pulleys, again moving the tensioner to allow the belt to be installed. Then release the belt tensioner.

## Tensioner replacement

Refer to illustrations 12.6a and 12.6b

1. To replace a tensioner that has lost its spring tension, replace the tensioner with a new one. Auto parts stores have the mounting bolts (see illustration).

2. Installation is the reverse of the removal process.

## 12.6 Underhood hose check and replacement every 6000 miles or 6 months

### General

**Caution:** Replacement of an air conditioning hose that is left in a stable position doesn't need an air conditioning shop that has the

equipment to depressure the system safely and recover the refrigerant. Some states or conditioning components or hoses and the system has been depressured.

1. High temperatures in the engine compartment can cause the deterioration of the rubber and plastic hoses used for engine, accessory and emission systems. Cracks, abrasions, fraying and other damage should be noted for cracks, loose clamps, material hardening and leaks. Information specific to the cooling system hoses can be found in Section 14.

2. Some fuel and oil hoses are secured to one thing with clamps. Where clamps are used, check to be sure they haven't loosened or broken, allowing the hose to leak. If clamps aren't used, make sure the hose has not separated under tension when it slips out of the fitting, allowing it to leak.

### Vacuum hoses

3. It's quite common for vacuum hoses, especially those in the emissions system, to be disconnected or identified by vacuum hoses

marked with their. Vacuum systems require hoses with different cut-thickness, collapse resistance and temperature resistance. When replacing hoses, be sure the new ones are made of the same material.

4. Often the only effective way to check a hose is to remove it completely from the vehicle. If more than one hose is removed, be sure to label the hoses and things to avoid system confusion.

5. When checking vacuum hoses, be sure to include any plastic fittings in the check against the things for cracks and the hose where it fits over the fitting for abrasion, which could cause leakage.

6. A good pinch of vacuum hose (1/4 inch inside diameter) can be used as a makeshift to replace vacuum hoses that are one of the hose in your car and provide enough vacuum hoses and things, looking for the fitting most components of a vacuum hose. **Warning:** When pinching with the vacuum hose makeshift, be very careful not to come into contact with moving engine components such as the crankshaft timing belt, etc.
