the life sciences including the discovery of life's molecular processes and substantive improvements in global public health and medicine. Combining perspectives from the history of science and world history, this volume examines the impact of major world historical processes of the postwar period on the evolution of the life sciences. Contributors consider the long-term evolution of scientific practice, research, and innovation across a range of fields and subfields in the life sciences and in the context of Cold War anxieties and ambitions. Together, they examine how the formation of international organizations and global research programs allowed for transnational exchange and cooperation but in a period rife with competition and nationalist interests which influenced dramatic changes in the field as the postcolonial world order unfolded. **Global**

Climate Change and Human Life M. A. K. Khalil, 2022-06-13 In our time, the global population has become large enough to cause perceptible environmental changes all over the world. With it, a new science of global change has emerged, mostly as a practical matter to understand and manage the earth's habitability and create a sustainable environment for some time to come, one which balances the benefits of technological and societal advances with their potential, less desirable side effects. These concerns began with the depletion of the ozone layer and its possible adverse consequences on human health and have in recent decades shifted to climate change driven by ongoing global warming. Why are these global changes occurring? How will they affect our lives? If we find the effects undesirable, what should we do? This book will attempt to answer these questions. It will show how to accomplish the goal of managing our climate, what it will take, and when it needs to be done. Such a management process has to be dynamic, making it more complex and less didactic, requiring changes in strategy to achieve a longer-term goal as our knowledge advances. *Global Climate Change and Human Life* is a comprehensive and cohesive look at the emerging field of global change science. Using models that take the theoretical or conceptual understanding and translate them into mathematical forms, the book lays out a holistic view of the science that develops and teaches the main principles, concepts, and conclusions. In the end, readers will be empowered to use science and the scientific method to decide how important and timely climate change is as a social issue and which solutions can succeed. **Global**

Health Disparities: Closing the Gap Through Good Governance Enku Kebede-Francis, 2010-09-15 One hundred countries, more than half of the world's population, have made significant strides in the last 30 years, improving life expectancy and the health of their populations. In this unique book, the author puts these and many other countries under the microscope through a detailed examination of best practices and best outcomes. Anchored on landmark UN declarations and based on numerous indices, including the World Development Index, *Global Health Disparities: Closing the Gap Through Good Governance* covers relevant policies and laws in international health and offers many data tables and figures.
