IB World Schools Yearbook 2012 ,2012 The Franciscana Dolphin Paulo Cesar Simoes-Lopes,Marta Jussara Cremer,2022-06-24 The Franciscana Dolphin On the Edge of Survival provides the most updated and comprehensive knowledge on the most endangered marine mammal in the Western South Atlantic Ocean It synthesizes all available information on this dolphin species also referred to as La Plata dolphin ranging from taxonomy evolution diet parasites and diseases reproduction and growth to genetic diversity and stock definition distribution abundance behavior as well as the threats and causes behind the dwindling population numbers Written by international experts this book explores aspects of the species natural history and urgent problems of accidental mortality in fishing nets contamination and habitat loss It offers the most current research and practices on rehabilitating debilitated animals and presents initiatives at the regional and international level for species conservation including current and potential strategies related to marine protected areas and public policies The Franciscana Dolphin On the Edge of Survival is an important resource for researchers and practitioners in marine conservation marine biology and zoology particularly those who seek to gain the most reputable information on vulnerable marine mammal species for conservation efforts Policymakers and public officials involved in environmental protection and planning will also find this useful to combat similar threats with other dolphin species around the world Offers the most up to date research of the species natural history biology and ecology Discusses current threats and solutions for species conservation which can be applied to other marine mammal species Provides updates on national and international agreements and policies for conservation efforts Systems Biology Approaches to Understanding the Cause and Treatment of Heart, Lung, Blood, and Sleep Disorders Raimond L Winslow,Jennie Larkin,Pankaj Qasba,2014-11-21 Development of powerful new high throughput technologies for probing the transcriptome proteome and metabolome is driving the rapid acquisition of information on the function of molecular systems The importance of these achievements cannot be understated they have transformed the nature of both biology and medicine Despite this dramatic progress one of the greatest challenges that continues to confront modern biology is to understand how behavior at the level of genome proteome and metabolome determines physiological function at the level of cell tissue and organ in both health and disease Because of the inherent complexity of biological systems the development analysis and validation of integrative computational models based directly on experimental data is necessary to achieve this understanding This approach known as systems biology integrates computational and experimental approaches through iterative development of mathematical models and experimental validation and testing The combination of these approaches allows for a mechanistic understanding of the function of complex biological systems in health and their dysfunction in disease The National Heart Lung and Blood Institute NHLBI has recognized the importance of the systems biology approach for understanding normal physiology and perturbations associated with heart lung blood and sleep diseases and disorders In 2006 NHLBI announced the Exploratory Program in

Systems Biology followed in 2010 by the NHLBI Systems Biology Collaborations The goal of these programs is to support collaborative teams of investigators in using experimental and computational strategies to integrate the component parts of biological networks and pathways into computational models that are based firmly on and validated using experimental data These validated models are then applied to gain insights into the mechanisms of altered system function in disease to generate novel hypotheses regarding these mechanisms that can be tested experimentally and to then use the results of experiments to refine the models The purpose of this Research Topic is to present the range of innovative new approaches being developed by investigators working in areas of systems biology that couple experimental and modeling studies to understand the cause and possible treatment of heart lung blood and sleep diseases and disorders This Research Topic will be of great interest to the cardiovascular research community as well as to the general community of systems biologists

Genomics in Aquaculture to Better Understand Species Biology and Accelerate Genetic Progress José Manuel Yáñez, Ross Houston, Scott Newman, 2016-09-15

From a global perspective aquaculture is an activity related to food production with large potential for growth Considering a continuously growing population the efficiency and sustainability of this activity will be crucial to meet the needs of protein for human consumption in the near future However for continuous enhancement of the culture of both fish and shellfish there are still challenges to overcome mostly related to the biology of the cultured species and their interaction with increasingly changing environmental factors Examples of these challenges include early sexual maturation feed meal replacement immune response to infectious diseases and parasites and temperature and salinity tolerance Moreover it is estimated that less than 10% of the total aquaculture production in the world is based on populations genetically improved by means of artificial selection Thus there is considerable room for implementing breeding schemes aimed at improving productive traits having significant economic impact By far the most economically relevant trait is growth rate which can be efficiently improved by conventional genetic selection i.e. based on breeding values of selection candidates However there are other important traits that cannot be measured directly on selection candidates such as resistance against infectious and parasitic agents and carcass quality traits e.g. fillet yield and meat color However these traits can be more efficiently improved using molecular tools to assist breeding programs by means of marker assisted selection using a few markers explaining a high proportion of the trait variation or genomic selection using thousands of markers to estimate genomic breeding values The development and implementation of new technologies applied to molecular biology and genomics such as next generation sequencing methods and high throughput genotyping platforms are allowing the rapid increase of availability of genomic resources in aquaculture species These resources will provide powerful tools to the research community and will aid in the determination of the genetic factors involved in several biological aspects of aquaculture species In this regard it is important to establish discussion in terms of which strategies will be more efficient to solve the primary challenges that are affecting aquaculture systems around the world The main objective of this Research Topic is to provide a forum to communicate recent research and implementation strategies in the use of genomics in aquaculture species with emphasis on 1 a better understanding of fish and shellfish biological processes having considerable impact on aquaculture systems and 2 the efficient incorporation of molecular information into breeding programs to accelerate genetic progress of economically relevant traits
