A Comprehensive Treatise on Inorganic and Theoretical Chemistry Joseph William Mellor,1929

Metallurgy W.H. Dennis,2017-07-12 The world's

output of metals during the 100 year period of 1863-1963 was greater than in all the previous years of man's history. In the nineteenth century the only metals available to industry were cast and wrought iron and a few non-ferrous metals and their alloys. By the latter part of the twentieth century steel and aluminum dominated the world and metals that were mere laboratory curiosities provided the basis for the technology of nuclear energy and space travel. This book records the extraordinary history of metallurgical progress in which metal art was replaced by metal science. It remains a classic work on the subject. The book begins with an introductory chapter that surveys the entire field to be covered and follows with eight chapters each dealing with progress in one of the major branches of the metallurgical industry: ore dressing, pyrometallurgy, iron and steel, the major non-ferrous metals, new metals such as uranium, germanium and cobalt, precious metals, the shaping of metals and metallography. The book reviews developments in all countries but American practice which led the world is given special prominence. A glossary of metallurgical terms and full name and subject indexes are included. The book is a basic reference work as well as an absorbing history of an important aspect of man's technological progress.

Cumulated Index Medicus, 1980 **High Performance Non-Oxide Ceramics I** M. Jansen, 2003-08-25

The nitrides and carbides of boron and silicon are proving to be an excellent choice when selecting materials for the design of devices that are to be employed under particularly demanding environmental and thermal conditions. The high degree of cross-linking due to the preferred coordination numbers of the predominantly covalently bonded constituents equalling or exceeding three lends these non-oxidic ceramics a high kinetic stability and is regarded as the microscopic origin of their impressive thermal and mechanical durability. Thus it does not come as a surprise that the chemistry, the physical properties and the engineering of the corresponding binary, ternary and even quaternary compounds have been the subject of intensive and sustained efforts in research and development. In the five reviews presented in the volumes 101 and 102 of *Structure and Bonding* an attempt has been made to cover both the essential and the most recent advances achieved in this particular field of materials research. The scope of the individual contributions is such as to address both graduate students specializing in ceramic materials and all scientists in academia or industry dealing with materials research and development. Each review provides in its introductory part the chemical, physical and to some extent historical background of the respective material and then focuses on the most relevant and the most recent achievements.

Functional Phthalocyanine Molecular Materials
Jianzhuang Jiang, 2010-02-02

Phthalocyanines exhibit intriguing physicochemical properties that render them important as a class of molecular functional materials. In addition to their traditional applications as dyes and pigments, more recently their use as the organic semiconductors, photodynamic therapy medicines, non-linear optical materials, catalysts for the photo-oxidation, optical recording materials and gas sensors attracts great research interests in these tetrapyrrole species.
