Mechanics of Residual Soils, Second Edition Geoffrey E. Blight,Eng Choon Leong,2012-05-03 Residual soils are found in many parts of the world and are used extensively as construction materials for roads embankments and dams and to support the foundations of buildings bridges and load bearing pavements The characteristics and engineering properties of residual soils can differ significantly from those of the more familiar transported soils The fact that residual soils occur often in areas with tropical and sub tropical climates and extensively in semi arid climates adds another dimension to their engineering performance that of unsaturation Although there are many books that deal with the mechanics of soils these are based mainly on the characteristics and behaviour of saturated transported soils The first edition of this book was the first book to be written specifically about the mechanics of residual soils The book was prepared by a panel of authors drawn from the Technical Committee on Tropical and Residual Soils of the International Society for Soil Mechanics and Foundation Engineering It was written as a practical professional guide for geotechnical engineers working with residual soils The second edition has retained the valuable information contained in the first edition The present editors and authors have extensively revised and augmented the content to bring it completely up to date adding significantly to the sections on unsaturated soil mechanics and expanding the range and number of instructive case histories Furthermore sections on pedocretes dispersive soils and karst have been added

7th RILEM International Conference on Cracking in Pavements A. Scarpas, Niki Kringos, I. Al-Qadi, Loizos A., 2012-08-30 In the recent past, new materials, laboratory and in situ testing methods, and construction techniques have been introduced. In addition, modern computational techniques such as the finite element method enable the utilization of sophisticated constitutive models for realistic model-based predictions of the response of pavements. The 7th RILEM International Conference on Cracking of Pavements provided an international forum for the exchange of ideas, information, and knowledge amongst experts involved in computational analysis, material production, experimental characterization, design, and construction of pavements. All submitted contributions were subjected to an exhaustive refereed peer review procedure by the Scientific Committee, the Editors, and a large group of international experts in the topic. On the basis of their recommendations, 129 contributions, which best suited the goals and the objectives of the Conference, were chosen for presentation and inclusion in the Proceedings. The strong message that emanates from the accepted contributions is that by accounting for the idiosyncrasies of the response of pavement engineering materials, modern sophisticated constitutive models in combination with new experimental material characterization and construction techniques provide a powerful arsenal for understanding and designing against the mechanisms and the processes causing cracking and pavement response deterioration. As such, they enable the adoption of truly mechanistic design methodologies. The papers represent the following topics: Laboratory evaluation of asphalt concrete cracking potential; Pavement cracking detection; Field investigation of pavement cracking; Pavement cracking modeling; response crack analysis and damage prediction; Performance of concrete pavements and white toppings; Fatigue cracking and damage characterization of asphalt concrete; Evaluation of the effectiveness of asphalt concrete modification; Crack growth parameters and mechanisms; Evaluation, quantification, and modeling of asphalt healing properties; Reinforcement and interlayer systems for crack mitigation; Thermal and low temperature cracking of pavements; and Cracking propensity of WMA and recycled asphalts.

Professional Issues *Foundation Engineering Handbook* Hsai-Yang Fang, 2013-06-29 More than ten years have passed since the first edition was published During that period there have been a substantial number of changes in geotechnical engineering especially in the applications of foundation engineering As the world population increases more land is needed and many soil deposits previously deemed unsuitable for residential housing or other construction projects are now being used Such areas include problematic soil regions mining subsidence areas and sanitary landfills To overcome the problems associated with these natural or man made soil deposits new and improved methods of analysis design and implementation are needed in foundation construction As society develops and living standards rise tall buildings transportation facilities and industrial complexes are increasingly being built Because of the heavy design loads and the complicated environments the traditional design concepts construction materials methods and equipment also need improvement Further recent energy and material shortages have caused additional burdens on the engineering profession and brought about the need to seek alternative or cost saving methods for foundation design and construction
