Evidence of Photosynthesis Lab 1

Chapter 3 Lesson 1

Background Information: PHOTOSYNTHESIS is the process during which a plant's chlorophyll traps light energy and sugars are produced. In plants, photosynthesis occurs only in cells with chloroplasts. The chemical reaction for photosynthesis is:

Green plants use energy from light to combine carbon dioxide and water to make food. **Light energy** is converted to chemical energy and is stored in the food that is made by green plants. The light used in photosynthesis is absorbed by a green pigment called **chlorophyll**. Each foodmaking cell in a plant leaf contains chlorophyll in small cells called **chloroplasts**. In chloroplasts, light energy causes water drawn from the soil to split into molecules of hydrogen and oxygen. In a series of chemical reactions, the hydrogen combines with carbon dioxide from the air, forming a simple sugar. Oxygen from the water molecules is given off in the process. From sugar, along with nutrients from the soil, green plants can make starch, fat, protein, vitamins, and other complex compounds necessary for life. Photosynthesis supplies the chemical energy needed to produce these compounds.

When a person exhales, carbon dioxide is released.

Bromothymol blue solution, BTB, can indicate the presence of carbon dioxide in the water. When little or no carbon dioxide is present, BTB will show a blue color. Depending upon the amount of carbon dioxide, BTB will change to green or yellow. Yellow indicates more carbon dioxide.

Rewilding Paul Jepson,Cain Blythe,2022-04-05 How rewilding has transformed the conservation movement combining radical scientific insights with practical innovations Progressive scientists and conservation professionals are pursuing a radical new approach to restoring ecosystems rewilding By recovering the ripple effect generated by the interactions among plant and animal species and natural disturbances rewilding seeks to repair ecosystems by removing them from human engineering and reassembling guilds of megafauna from a mix of surviving wild and feral species and de domesticated breeds including elk bison and feral horses Written by two leaders in the field this book offers an abundantly illustrated guide to the science of rewilding It shows in fascinating detail the ways in which ecologists are reassembling ecosystems that allow natural interactions rather than human interventions to steer their environmental trajectories Rewilding looks into a past in which industrialization and globalization downgraded grasslands describes current

projects designed to recover self-willed ecosystems and envisions the future with ten predictions for a rewilded planet. It shows how rewilding is shaking up conservation science and policy, bringing new hope and renewed purpose to efforts to revive essential ecological processes.
