

## Describe the layers of the earth

## What are convection currents

Convection currents are heat currents that move in a circular motion beneath the crust of the Earth. They are made when the core heats up the molten rock in lower mantle, the hot molten rock nearest to the core rises, cools down and sinks to be heated up again by the core. This causes plate tectonics to move.

## What are plumes?

Plumes are parts of convection cells where heat moves towards the surface. They create concentrated zones of heat and bring magma to the surface. If magma breaks through the crust, it erupts as lava in a volcano.

## Features of a composite volcano

- Magma is thick and viscous
- Mix of basaltic and granitic magma
- Steep sided
- Lava explodes
- Pyroclastic flows
- Ash clouds
- Mostly form at destructive boundaries
