Cardiovascular Remodeling Yan Yang, Yi Zhang, Ming Lei, Gui-Rong Li, 2023-08-25 Although the treatment has greatly progressed the mortality of cardiovascular diseases remains the leading cause of death worldwide Serious cardiovascular diseases e.g. myocardial infarction heart failure cardiac dysrhythmias and stroke are resulted from cardiovascular remodeling secondary to the cardiovascular risk factors including hypertension atherosclerosis cigarette smoking diabetes mellitus hyperlipidemia aging etc Cardiac remodeling involves a series of molecular cellular and interstitial alterations which manifest clinically as changes in size mass geometry and function of the heart In addition vascular remodeling is an active process of structural alteration involving vascular wall thickening and lumen stenosis due to endothelial injury vascular smooth muscle cell proliferation and matrix deposition This results in atherosclerosis and or stenosis followed by myocardial infarction stroke etc Thus studies on the mechanism of cardiovascular remodeling and new therapeutic approaches are important scientifically and clinically Cardiovascular remodeling is a response of specific cardiovascular cells including cardiomyocytes endothelial smooth muscle cells and interstitial cells to noxious hemodynamic metabolic and inflammatory stimuli The remodeling may initially be functional compensatory and adaptive but it progresses to structural alterations that become pathogenic when the damaging stimuli are sustained The mechanism of cardiovascular remodeling is complex and recent studies focus on improving and or reversing the remodeling by clarifying molecular mechanisms and identifying novel therapies Pharmacological anti remodeling RNA based long non coding RNA and microRNA treatment cell based iPS cardiac repair and cell free exosome approaches have been shown to improve cardiovascular remodeling alongside proangiogenic pro survival proliferative and immunogenic factors stimulating endogenous proliferative potential of cardiomyocytes However though advanced studies have progressed the prognosis of the affected patients remains poor Therefore understanding novel mechanisms identifying remodeling biomarkers and developing new therapeutic drugs and approaches can lead to new therapeutic options for treating patients with cardiovascular diseases

Immunohistochemical Expression Rosario Caltabiano, Carla Loreto, 2021-09-02 Immunohistochemistry IHC is an ancillary method widely used in pathologists practice that allows identifying diagnostic and prognostic predictive of therapeutic response protein markers on tissue samples by the use of specific monoclonal antibodies

and chromogenic substances that guarantee the visualization of an antibody antigen binding complex under a light microscope 1 Coon et al in 1941 2 first introduced the use of fluorochrome conjugated antibodies in clinical practice Since then IHC has gone from being a useful tool for identifying the differentiation line of otherwise undifferentiated cells to a technique capable of providing not only diagnostic but also prognostic and predictive indications of responses to specific therapeutic options 1 3 The abovementioned peculiarities have made IHC one of the most used ancillary methods in the histopathological approach to human neoplastic and non neoplastic diseases 3 5 This Special Issue contains 11 accepted papers that provide readers with a comprehensive update on current and future applications of IHC in medical practice

Li, 2021-09-08 Numerous pathogens affect animal health and wellbeing and production efficiency These pathogens also have a considerable impact on social economics food safety and security and human health Infectious diseases that originate from both domesticated animals and wildlife represent one of the greatest threats to human health Recent studies show that domesticated species harbor approximately 84 times more zoonotic viruses than wild species Eight of the top 10 mammalian species with the highest number of zoonotic viruses are domestic such as pigs cattle and horses Many animal

parasites are also zoonotic constituting an additional burden on human health Furthermore the rapid emergence and spread of drug resistant pathogen strains pose new threats to animal and human health Climate changes will undoubtedly alter the interactions between animals and between animals and humans which will have a huge impact on the transmission rate of existing pathogens and the emergence of new pathogens or the reemergence of old pathogens In this special collection interactions of all major pathogen types including viruses bacteria mites and flies protozoans and helminths and their hosts such as wild and companion animals and livestock species are discussed Further anthelmintic activities of natural products are evaluated The relevance and utility of cutting edge tools such as immunology genomics and genetics microbiome studies and metabolomics and molecular epidemiology in dissecting host pathogen interactions are also discussed This special collection provides a broad knowledge base that encourages dialogue across a wide distribution of the research community in veterinary microbiology and parasitology
