decades soil organic carbon SOC attracted the attention of a much wider array of specialists beyond agriculture and soil science as it was proven to be one of the most crucial components of the earth's climate system which has a great potential to be managed by humans. Soils as a carbon pool are one of the key factors in several Sustainable Development Goals in particular Goal 15 Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification and halt and reverse land degradation and halt biodiversity loss, with the SOC stock being explicitly cited in Indicator 15.3.1. This technical manual is the first attempt to gather in a standardized format the existing data on the impacts of the main soil management practices on SOC content in a wide array of environments including the advantages, drawbacks and constraints. This manual presents different sustainable soil management (SSM) practices at different scales and in different contexts supported by case studies that have been shown with quantitative data to have a positive effect on SOC stocks and successful experiences of SOC sequestration in practical field applications. Volume 4 includes 51 case studies dealing with cropland, grassland, integrated systems and farming approaches.

Greenhouse gas accounting in the forestry sector Food and Agriculture Organization of the United Nations, 2025-03-03. This report aims to illustrate the methodological improvements for estimating greenhouse gas (GHG) emissions and removals from forest management practices and disturbances implemented in the FAO's Environmental eXternalities ACcounting Tool (EX-ACT), an online accounting app that estimates and tracks the outcomes of agricultural interventions on environmental externalities including GHG emissions. It highlights key updates from the previous tool's version EX-ACT v.9 and shows the main limitations that have been overcome through a change in methodology. The revision follows the International Panel on Climate Change's Guidelines for National Greenhouse Gas Inventories (2006, 2019). The methodology update now better reflects the effects of various forest management interventions on yearly GHG emissions and reductions as beforehand the tool only considered overall forest biomass changes over the entire accounting period. The updated EX-ACT online app now provides a more detailed approach accounting for both positive and negative changes in forest carbon stocks as well as multiple drivers of changes in forest carbon stocks including forest management, thinning, logging, reduced impact logging, etc. and use of timber, fuelwood as well as disturbances, fire, forest pests and diseases, storms, drought, etc. A major shift in methodology is the transition from the Stock Difference approach to the Gain/Loss approach to capture annual changes of forest carbon stocks. The refined methodology improves estimates of GHG emissions and reductions, offering a valuable tool for assessing the climate change mitigation effects of forestry activities in agrifood investment activities, projects, programmes and policies.

result of a collaborative process involving a wide range of numerous individuals around the world. These people assisted in drafting case studies and other contributions reviewing the text and suggesting substantive and formatting changes.

Engel, Sally Hawkins, Rene Beyers, Yue Cao, 2025-03-03 Rewilding is a long term and large scale process which works to restore degraded ecosystems or social ecological systems to the point that they are resilient and self-sustaining and therefore requiring little in terms of conservation management. Rewilding practice focuses on re-establishing ecological processes including trophic levels that were lost mainly due to anthropogenic

disturbance It also aims to affect a paradigm shift in human nature relationships with intentions to better understand the interdependencies between humans and nature so that people can appreciate and accommodate nature in their landscapes and make more informed and sustainable decisions about how we live In this sense rewilding has real transformational potential

The Politics of Carbon Markets Benjamin Stephan, Richard Lane, 2014-08-27 The carbon markets are in the middle of a fundamental crisis a crisis marked by collapsing prices fleeing actors and ever increasing greenhouse gas levels Yet carbon trading remains at the heart of global attempts to respond to climate change Not only this but markets continue to proliferate particularly in the Global South The Politics of Carbon Markets helps to make sense of this paradox and brings two urgently needed insights to the analysis of carbon markets First the markets must be understood in relation to the politics involved in their development maintenance and opposition Second this politics is multiform and pervasive Implementation of new techniques and measuring tools policy development and contestation and the structuring context of institutional settings and macro social forces all involve a variety of political actors and create new forms of political agency The contributions study the total extent of the carbon markets from their prehistory to their contemporary expansion and wider impacts This wide ranging political perspective on the carbon markets is invaluable to those studying and interested in ecological markets climate change governance and environmental politics
