

Applying the Concepts: Chapter 3

1. Attention K-Mart Shoppers

K-Mart dresses are produced in the thousands, not the dozens, so there is less incentive to shirk the suppliers of intermediate inputs. The design and fabrication of K-Mart dresses does not require as much face time between dressmakers and the producers of intermediate goods such as buttons because (a) there is less experimentation and design innovation because K-Mart picks successful designs and produces them in mass and (b) new dresses are introduced less frequently.

2. Labor Pooling: What's Fixed and Variable?

Consider the model of labor pooling, with each firm locating either in an isolated site or in a cluster with other firms. Fill the blanks with "fixed" or "variable".

- In an isolated site, the wage is variable and the firm's workforce is fixed because the supply of labor is perfectly inelastic.
- In a cluster, the wage is fixed and the firm's workforce is variable because the supply of labor is perfectly elastic.
- See Figure 3-2.

3. Tradeoffs with Clustering for Labor Pooling

- In the left panel of Figure 3-2, the wages are \$40 and \$20, and the quantity is 50 workers. In the right panel of Figure 3-2, the wage is \$30, and the quantities are 40 and 60 workers.
- During good times, the benefit of being in the cluster as opposed to being isolated is \$550, computed as $(\$40 - \$20) \times 50 \text{ workers} = (1/2) \times (\$40 - \$20) \times 10 \text{ workers}$.
- During bad times, the cost of being in the cluster as opposed to being isolated is \$450, computed as $(\$30 - \$20) \times 40 \text{ workers} = (1/2) \times (\$30 - \$20) \times 10 \text{ workers}$.
- The benefit exceeds the cost because a firm in a cluster changes its workforce when demand changes.

4. Mr. Mallet's Carnival

- In the left panel of Figure 3-2 (small city), the wages are \$6 and \$12 and the quantity is 20 workers. In the right panel of Figure 3-2 (large city) the wage is \$9, and the quantities are 10 and 30 workers.
- In the typical big city with high demand, his profit is \$135 computed as $(1/2) \times (\$18 - \$9) \times 30 \text{ workers}$.
- In the typical big city with low demand, his profit is \$15 computed as $(1/2) \times (\$12 - \$9) \times 10 \text{ workers}$.
- In the typical small city with high demand, his profit is \$60 computed as $(1/2) \times (\$18 - \$12) \times 20 \text{ workers}$.
- In the typical small city with low demand, his profit is \$60 computed as $(1/2) \times (\$12 - \$6) \times 20 \text{ workers}$.
- In the typical small city with high demand, his profit is \$_____ computed as _____.
- In the typical small city with low demand, his profit is \$_____ computed as _____.
- His expected profit is \$75 in a big city, compared to \$60 in a small city.

Sarah Bretschneider,2012-07-20 Disasters like floods hurricanes chemical or nuclear accidents may cause the necessity to evacuate the affected area The evacuation of the urban area needs to be planned carefully One issue is the reorganization of the traffic routing Congested urban areas have usually complex street networks that are composed of many intersections with streets connecting them The population density of a congested urban area is usually high and the street network is already used to capacity during rush hour traffic The considered problem of this work is the reorganization of the

traffic routing of an urban area for the case of an emergency mass evacuation Especially aspects of the evacuation like safety avoidance of delays and the total system travel time are taken into account Combinatorial and graph theoretical aspects are adapted for the evacuation problem and highlight issues concerning especially conflicts within intersections This work gives an extensive summary of literature of evacuation of urban areas Mixed integer linear programming models are developed for evacuation problems and heuristic algorithms are provided and tested *Housing Market Challenges in Europe and the United States* P. Arestis,P.
