

AP Environmental Science Study Guide

Chapter 15

Key Terms

Aquifers	artesian aquifer	confined aquifer	consumptive use
dam	desalination	flooding	floodplain
fresh water	groundwater	nonconsumptive use	nonpoint source
point source	pollution	primary treatment	reservoir
secondary treatment	septic systems	sinkholes	surface water
unconfined aquifer	wastewater	water pollution	watershed
water table	wetlands		

I. Central Case Study: Starving the Louisiana Coast of Sediment

- A. Since the 1930s alone, Louisiana has lost nearly 4900 km² (1900 mi²) of coastal wetlands—an area roughly the size of Delaware.
- B. The salt marshes in the river's delta naturally compact over time. This compaction lowers the level of the marsh bottom and submerges vegetation under increasingly deeper waters.
- C. So why are Louisiana's wetlands being swallowed by the sea? It's because people have modified the Mississippi River so extensively that much of its sediments no longer reach the wetlands that need them.
- D. Also, levees prevent the river from fanning out into its delta and turn the lower Mississippi into a "barrel" that shoots sediments off the continental shelf into the deep waters of the Gulf.
- E. And although Louisiana's economy has benefited from oil and gas extraction, these activities have also promoted wetland losses.
- F. Proposed solutions for coastal erosion center on restoring the system to its natural state by diverting large quantities of water from the Mississippi River into coastal wetlands instead of shot gunning it out into the Gulf in the river's main channel.

II. Freshwater Systems

Of all the water on Earth, only 2.5% is considered fresh water—or water that is relatively pure, with few dissolved salts. Most of that is tied up in glaciers, ice caps, and aquifers. Water is renewed and recycled as it moves through the water cycle.

A. Groundwater plays key roles in the hydrologic cycle.

1. Surface water is water located atop Earth's surface and groundwater is water beneath the surface held within pores in soil or rock.
2. Groundwater is contained within aquifers: porous, spongelike formations of rock, sand, or gravel that hold water. An aquifer's upper layer, or zone of aeration, contains pore spaces partly filled with water. In the lower layer, or zone of saturation, the spaces are completely filled with water. The boundary between these two zones is the water table.
