

Spiral Torsion Springs

General Data

Spiral torsion springs, which are usually made of rectangular section material, are wound flat, generally with an increasing space between the coils. The torque delivered per revolution is linear for the first 360°. At greater angular rotations, the coils begin to close on the arbor, and the torque per turn increases rapidly. For this reason, springs of this type are usually used in applications requiring less than 360° of rotation.

Design Formulas

The formula for torque delivered by a spiral torsion spring is:

$$(1) \quad M = \frac{\pi E b t^3 \theta}{6L} \text{ lb.} \cdot \text{in. (N} \cdot \text{mm)}$$

where:

E = Modulus of elasticity, psi (MPa)

θ = Angular deflection in revolutions

L = Length of active material, in. (mm)

M = Moment or torque, lb.·in (N·mm)

b = Material width, in. (mm)

t = Material thickness, in. (mm)

The stresses imposed on a spiral torsion spring are in bending, and the deflecting beam formula for stress may be used:

$$(2) \quad S = \frac{6M}{bt^2} \text{ psi (MPa)}$$

Spiral torsion springs for general use can be stressed from 175,000 to 200,000 psi (1210–1380 MPa), depending on material hardness. In applications where higher stresses and material fatigue are involved, it is suggested that a spring manufacturer be consulted.

The arbor diameter (A) and outside diameter in the free condition (OD_f) do not appear in the formulas for torque or stress, but the space occupied by the spring must be considered in design. A spring which is too small may wind up tight on the arbor before the desired deflection is reached. If the outside diameter is too

large, the spring will not fit the space available.

The following formula, based on concentric circles with a uniform space between the coils, gives a close approximation of the minimum OD_f :

$$OD_f = \frac{2L}{\pi \left(\sqrt{A^2 + 1.27Li} - A - \theta \right)} - A \text{ in. (mm)}$$

Figure 1.

Design Example

Assume that a spiral torsion spring is made of 0.032 in. (0.81 mm) thick by 0.250 in. (6.35 mm) wide 1070 carbon steel and must deliver a moment of 4.5 lb.·in. (508 N·mm) at 135° deflection. The spring is to work over a 0.250 in. (6.35 mm) diameter arbor. What is the active length of material required, the stress imposed on the spring, and the spring O.D.?

Transposing the formula for torque, active length of material (L) is given by:

$$L = \frac{\pi E b t^3 \theta}{6M} \text{ in. (mm)}$$

where

$$\theta = \frac{135^\circ}{360^\circ} = 0.375 \text{ Revolutions}$$

$$L = \frac{\pi(30 \times 10^6)(0.25)(0.032)^3(0.375)}{6(4.5)} = 10.72 \text{ in. (272.3 mm)}$$

(L does not include the material needed for the end configurations)

$$S = \frac{6(4.5)}{0.25(0.032)^2} = 105,000 \text{ psi (724 MPa)}$$

$$OD_f = \frac{2(10.72)}{3.14 \left(\sqrt{0.25^2 + 1.27(10.72)(0.032)} - 0.25 - 0.375 \right)} - 0.25$$

$$OD_f = 0.762 \text{ in. (19.35 mm)}$$

NASA Tech Briefs ,2007 **Tribology of Miniature Systems** Z. Rymuza,1998-06-01 The tribology of miniature systems is quite different from the tribology of large machinery This is the first publication to cover on an academic level both the basic concepts of the tribology of miniature systems and some areas of its practical application A comprehensive survey is given on the specific problems encountered in this field providing a volume that will be useful in solving professional engineering problems in the fast growing field of precision engineering and microtechnology The suitability of various materials and lubricants for the tribological systems in miniature mechanisms is discussed The tribological properties and the friction and wear properties which occur in such systems are analysed Specific lubrication problems are examined in detail in particular the use of special tribological coatings to solve many difficult lubrication problems and to obtain high wear resistance of the rubbing elements is considered The special investigation techniques used to characterize miniature tribological systems and their elements e g lubricants are reviewed The tribological aspects of many of the most common assemblies found in miniature mechanism and electromechanism design are analysed and some practical suggestions are put forward for the rational design of such systems Also special

tribological problems such as those met in computer technology bioengineering etc are presented The book is intended for tribologists both seasoned researchers and newcomers studying the problems of this specific branch of tribology and also for practising engineers active in the design manufacture and exploitation of various miniature systems
