

Abstract: The purpose of this study was to determine the effect of a 12-week training program on the physical fitness and health-related quality of life (HRQL) of elderly people. The study was conducted in a community center in a large city in Brazil. The participants were 30 elderly people (mean age = 68.5 years) who were randomly divided into two groups: a control group (n = 15) and an intervention group (n = 15). The intervention group participated in a 12-week training program consisting of aerobic, strength, and flexibility exercises. The control group did not participate in any training program. The physical fitness and HRQL were assessed at baseline and at the end of the 12-week period. The results showed that the intervention group had significant improvements in physical fitness and HRQL compared to the control group. The improvements were observed in all the variables measured, including aerobic capacity, strength, flexibility, and the SF-36 HRQL score. The findings suggest that a 12-week training program can improve the physical fitness and HRQL of elderly people.
