Open Market Operations

Like the Federal Reserve, the European Central Bank uses open market operations as its primary tool for conducting monetary policy and setting the overnight cash rate at the target financing rate. **Main refinancing operations** are the predominant form of open market operations and are similar to the Fed's repo transactions. They involve weekly **reverse transactions** (purchase or sale of eligible assets under repurchase or credit operations against eligible assets as collateral) that are reversed within two weeks. Credit institutions submit bids, and the European Central Bank decides which bids to accept. Like the Federal Reserve, the European Central Bank accepts the most attractively priced bids and makes purchases or sales to the point where the desired amount of reserves are supplied. In contrast to the Federal Reserve, which conducts open market operations in one location at the Federal Reserve Bank of New York, the European Central Bank decentralizes its open market operations by having them be conducted by the individual national central banks.

A second category of open market operations is the **longer-term refinancing operations**, which are a much smaller source of liquidity for the euro-area banking system and are similar to the Fed's outright purchases or sales of securities. These operations are carried out monthly and typically involve purchases or sales of securities with a maturity of three months. They are not used for signaling the monetary policy stance, but instead are aimed at providing euro-area banks with additional longer-term refinancing.

Lending to Banks

As for the Fed, the next most important tool of monetary policy for the European Central Bank involves lending to banking institutions, which is carried out by the national central banks, just as discount lending is performed by the individual Federal Reserve Banks. This lending takes place through a standing lending facility called the **marginal lending facility**. There, banks can borrow (against eligible collateral) overnight loans from the national central banks at the **marginal lending rate**, which is set at 100 basis points above the target financing rate. The marginal lending rate provides a ceiling for the overnight market interest rate in the European Monetary Union, just as the discount rate does in the United States. Just as the Fed does, the European has another standing facility, the **deposit facility**, in which banks are paid a fixed interest rate that is 100 basis points below the target financing rate. The prospective interest rate on the **deposit facility** provides a floor for the overnight market interest rate, while the marginal lending rate sets a ceiling.

Reserve Requirements

Like the Federal Reserve, the European Central Bank imposes reserve requirements on banks that do not have a right of withdrawal on required to hold 2% of the total amount of their liabilities to the Fed. These deposits are known as **required reserves**. The central bank also has a **voluntary reserve** system, which is subject to regular returns and is subject to the **voluntary reserve** system. Banks wishing to borrow from the Fed must provide open market operations. Like the Federal Reserve, the European Central Bank also has a **voluntary reserve** system, which is subject to regular returns and is subject to the **voluntary reserve** system.

period, and a Government Sponsored Program, in which the Fed made a \$100 billion of debt issued by Freddie Mac and other asset enterprises (GSEs), as well as mortgage-backed securities from 2005.

After the Lehman Brothers failure, the Fed made large amounts of credit directly to banks that needed to be bailed out. The Fed agreed to lend over \$100 billion to AIG and also authorized the Fed of New York to purchase most other risky securities from AIG to get it into the company. In November 2008, the Fed agreed to lend over \$200 billion to absorb 90% of the federal government's government securities, while in January, it bailed out Bank of America, committing

the Fed's lender-of-last-resort program. The 2007-2009 financial crisis was responding the Fed's balance sheet dollars by the end of 2008, more than doubled. The increase in the Fed's balance sheet demonstrates the Fed's role in getting the financial system back on track.

Monetary policy tool became a for banks with low reserves in the past, it usually works by making the discount rate providing reserves to banks. Payments would also cause management more difficult.

Central Bank

Central banks (which is usually the case of its monetary policy) is used for the **overnight** cash rate is the interest rate used by the European Central Bank and involve open market operations.
