*The Sustainable City XV* S. Syngellakis, 2021-12-13 Consisting of presented papers from the 15th International Conference on Urban Regeneration and Sustainability the included works address various aspects of the urban environment and provide solutions leading towards sustainability Urban areas result in a series of environmental challenges varying from the consumption of natural resources and the subsequent generation of

waste and pollution contributing to the development of social and economic imbalances As cities continue to grow all over the world these problems tend to become more acute and require the development of new solutions The challenge of planning sustainable contemporary cities lies in considering the dynamics of urban systems exchange of energy and matter and the function and maintenance of ordered structures directly or indirectly supplied and maintained by natural systems The task of researchers is to improve the capacity to manage human activities pursuing welfare and prosperity in the urban environment Any investigation or planning on a city ought to consider the relationships between the parts and their connections with the living world The dynamics of its networks flows of energy matter people goods information and other resources are fundamental for an understanding of the evolving nature of today s cities Large cities represent a fertile ground for architects engineers city planners social and political scientists and other professionals able to conceive new ideas and time them according to technological advances and human requirements Coastal areas and coastal cities are an important area covered in this volume as they have some specific features Their strategic location facilitates transportation and the development of related activities but this requires the existence of large ports with the corresponding increase in maritime and road traffic and all its inherent negative effects This requires the development of well planned and managed urban environments not only for reasons of efficiency and economics but also to avoid inflicting environmental degradation that causes the deterioration of natural resources quality of life and human health These research papers put a focus on sustainability across the multidisciplinary components of urban planning the challenges presented by the increasing size of cities the number of resources required and the complexity of modern society

Calibration of the Hcm 2010 Roundabout Capacity Equations for Georgia Conditions Christina Danielle Barry, 2012 There is increased interest in building modern roundabouts in Georgia and in the United States because of the safety and operational benefits that can be realized from this type of intersection With this interest comes the increasing need to be able to estimate the capacity that a roundabout can provide after it is built In the early 2000s a National Cooperative Highway Research Program NCHRP study was conducted that among other tasks developed single lane and multi lane roundabout capacity estimation equations These equations presented in the Highway Capacity Manual 2010 HCM 2010 can be calibrated using locally determined values of follow up headway and critical headway This study was designed to calibrate the HCM 2010 roundabout capacity equation for single lane roundabouts to driving conditions in Georgia In order to develop estimates of the calibration parameters video imagery was recorded for 13 approaches at six roundabouts in Georgia for approximately two hours during the peak period A total of 29 5 hours of video was recorded Data from three of these roundabouts forms the basis of this thesis The videos were processed by a Java program to collect time stamps that were subsequently used in Microsoft Excel to calculate the follow up and critical headway values required for calibration The values of critical headway and follow up headway that were found from the video data are presented in the results as well as the single lane capacity equations calibrated from the data Two

types of analysis were done one that includes exiting vehicles and one that does not include exiting vehicles When exiting vehicles were excluded the weighted average of follow up and critical headway were found to be 3.46 and 4.17 seconds respectively and when exiting vehicles were included in the analysis the weighted averages of the follow up and critical headway were found to be 2.80 seconds and 3.34 seconds respectively It was found that exiting vehicles do have an impact on the operations at the roundabout in most cases and including exiting vehicles in the analysis tends to increase the capacity predicted by the calibrated equations
