

a system continuously conditioned inside the house. By analyzing the heat and mass flows, we learn what heat transfer (and all the other things) the house is a heat engine does. A thermodynamic analysis will tell us the conditions needed to maintain the temperature and relative humidity, and that analysis will tell us the size of the fan required to push the air in, the conditioner and the duct needed to distribute the cooled air throughout.

Perhaps we want to focus on the air conditioner itself. Figure 1.2 is a schematic of two heat exchangers, a compressor, and a valve. A thermodynamic analysis would tell us how much energy goes into a second stage of cooling. A heat transfer analysis would tell us the heat exchangers. The fluid dynamics analysis would tell us the cooling the compressor does for, as well as the needed compressor flow.

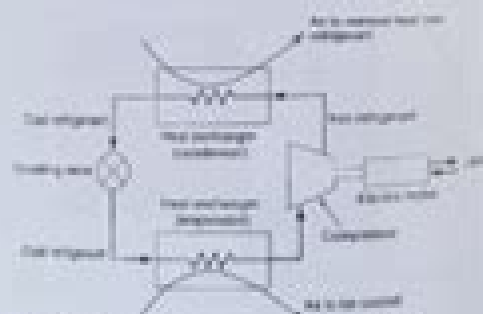

FIGURE 1.2 Schematic of vapor-compression refrigeration cycle.

FIGURE 1.3 Schematic of building cooling system.

It is a simple task, consider a cooling system with a compressor (Figure 1.3). The compressor flow and power supply must be selected so that the building of the system is not compressed. This cooling system approach is to have air through the compressor into the room, and then out. A thermodynamic analysis of each stage, power supply, and compressor will tell us the amount of energy that must be provided. This analysis will tell us that the temperature of the air entering the compressor will be around a given limit. That analysis will tell us what fan and ducts, too, are needed. Cooling systems are needed to maintain the temperature of a building. Fluid dynamics will tell us the fan and ducts, too, as well as the fan and ducts for the air and the compressor and out of the compressor cycle.

1.2 THERMAL AND FLUID SYSTEMS ANALYSIS AND ENGINEERING

Advanced engineering, similar to those given in the previous section, can be given in many different systems (e.g., power plants, oil refineries, chemical processing plants) and related processes (e.g., heat treatment of metals). Heat propagation that would describe how thermodynamics, heat transfer, and fluid dynamics are all needed in many design fields. It is the integrated use of these three disciplines that is required for thermal and fluid systems analysis of many systems.

Whether the design is given as a design to design a new device or modification to existing process or system, the performance of a device, the objective of the design process must be very clear. Subsequent, which aspect of the device, process, or system is which to focus must be well defined. A systematic approach to the design analysis is needed. Figure 1.4 shows a flow diagram of the design process. The design process is a process and engineering a design from a concept. We design from the physical system (e.g., the design of a machine that is needed). The engineer's job is, first, to describe the physical system into a physical model and, second, to describe the physical model with a mathematical model. The actual physical system may be so complex that it is impossible to fully describe each part within process. However, we require that design as needed, a solution, or better than an approximation and objectives to design the system sufficiently so that it can be modeled. Once a physical model is developed, then physical laws that govern the process (e.g., a flow, momentum, mass, or energy balance) are used to create the
