Features include multiple date land cover analyses as change in land cover influences water quality model sensitivity analyses of DEM resolution and influences on modeling water characteristics like Manning's n development of seabed cover classification and sensitivity and forecasting urban growth over time with climate vulnerability impacts on water. A detailed case study presents a range of water quality issues all effectively demonstrating GT inputs to water quality studies from headwaters to receiving estuarine waters. Also analyzed are the comparison of evapotranspiration simulation performance by APEX model in dryland and irrigated cropping systems and perspectives on the future of transient storage modeling. Captures advanced technologies and applications for implementation with models to address a broad spectrum of water issues. Provides real world applications and case studies using advanced spectral and spatial sensors combined with geospatially facilitated water process models. Features a Neuse River Basin case study integrating hydrologic methods and modeling along with remote sensing and GIS technologies for nonpoint source water quality evaluations. Global coverage with applications demonstrated by more than 170 experts from around the world. This handbook is a wide ranging and contemporary reference of advanced geospatial techniques used in numerous practical applications at the local and regional scale and is an in depth resource for professionals and the water research community worldwide.

Google Earth Engine Applications Lalit Kumar, Onesimo Mutanga, 2019-04-23 In a rapidly changing world there is an ever increasing need to monitor the Earth's resources and manage it sustainably for future generations. Earth observation from satellites is critical to provide information required for informed and timely decision making in this regard. Satellite based earth observation has advanced rapidly over the last 50 years and there is a plethora of satellite sensors imaging the Earth at finer spatial and spectral resolutions as well as high temporal resolutions. The amount of data available for any single location on the Earth is now at the petabyte scale. An ever increasing capacity and computing power is needed to handle such large datasets. The Google Earth Engine GEE is a cloud based computing platform that was established by Google to support such data processing. This facility allows for the storage processing and analysis of spatial data using centralized high power computing resources allowing scientists researchers hobbyists and anyone else interested in such fields to mine this data and understand the changes occurring on the Earth's surface. This book presents research that applies the Google Earth Engine in mining storing retrieving and processing spatial data for a variety of applications that include vegetation monitoring cropland mapping ecosystem assessment and gross primary productivity among others. Datasets used range from coarse spatial resolution data such as MODIS to medium resolution datasets Worldview 2 and the studies cover the entire globe at varying spatial and temporal scales.
