Scaled Planar Floating-gate NAND Flash Memory Technology Shyam Sunder Raghunathan,2010 NAND flash memories are ubiquitous in their use as portable storage media in cellphones cameras music players and other portable electronic devices The NAND flash memory device consisting of a floating gate transistor cell is the most aggressively scaled electronic device as evidenced by ever increasing memory capacities In this work we will examine possible problems arising from continued scaling of these structures and discuss novel solutions to overcome them Firstly we investigate scaling of the conventional poly silicon floating gate aimed at reducing cell to cell interference We experimentally delineate a new reliability concern for the first time with programming current through ultra thin poly silicon floating gates becoming increasingly ballistic We also experimentally demonstrate doping related issues in the poly silicon floating gate We then apply a novel metal based floating gate cell for the first time designed to overcome the problems discussed above We explore factors that influence the choice of metal and demonstrate excellent functionality in ultra thin metal floating gate cells scaled down to 3 nm TiN floating gate thickness thus greatly reducing cell to cell interference Finally in order to facilitate continued scaling of the control dielectric we explore replacement of the conventional silicon oxide nitride dielectric with high k dielectric materials We integrate poly silicon and metal floating gate cells with Al₂O₃ high k control dielectric Further we establish that a deeper work function control gate is helpful in reducing gate injection Combining ultra thin metal floating gate high k control dielectric and deep work function control gate we
